

Manufacturing Systems III

System Design and Simulation #2: Lean Game

1

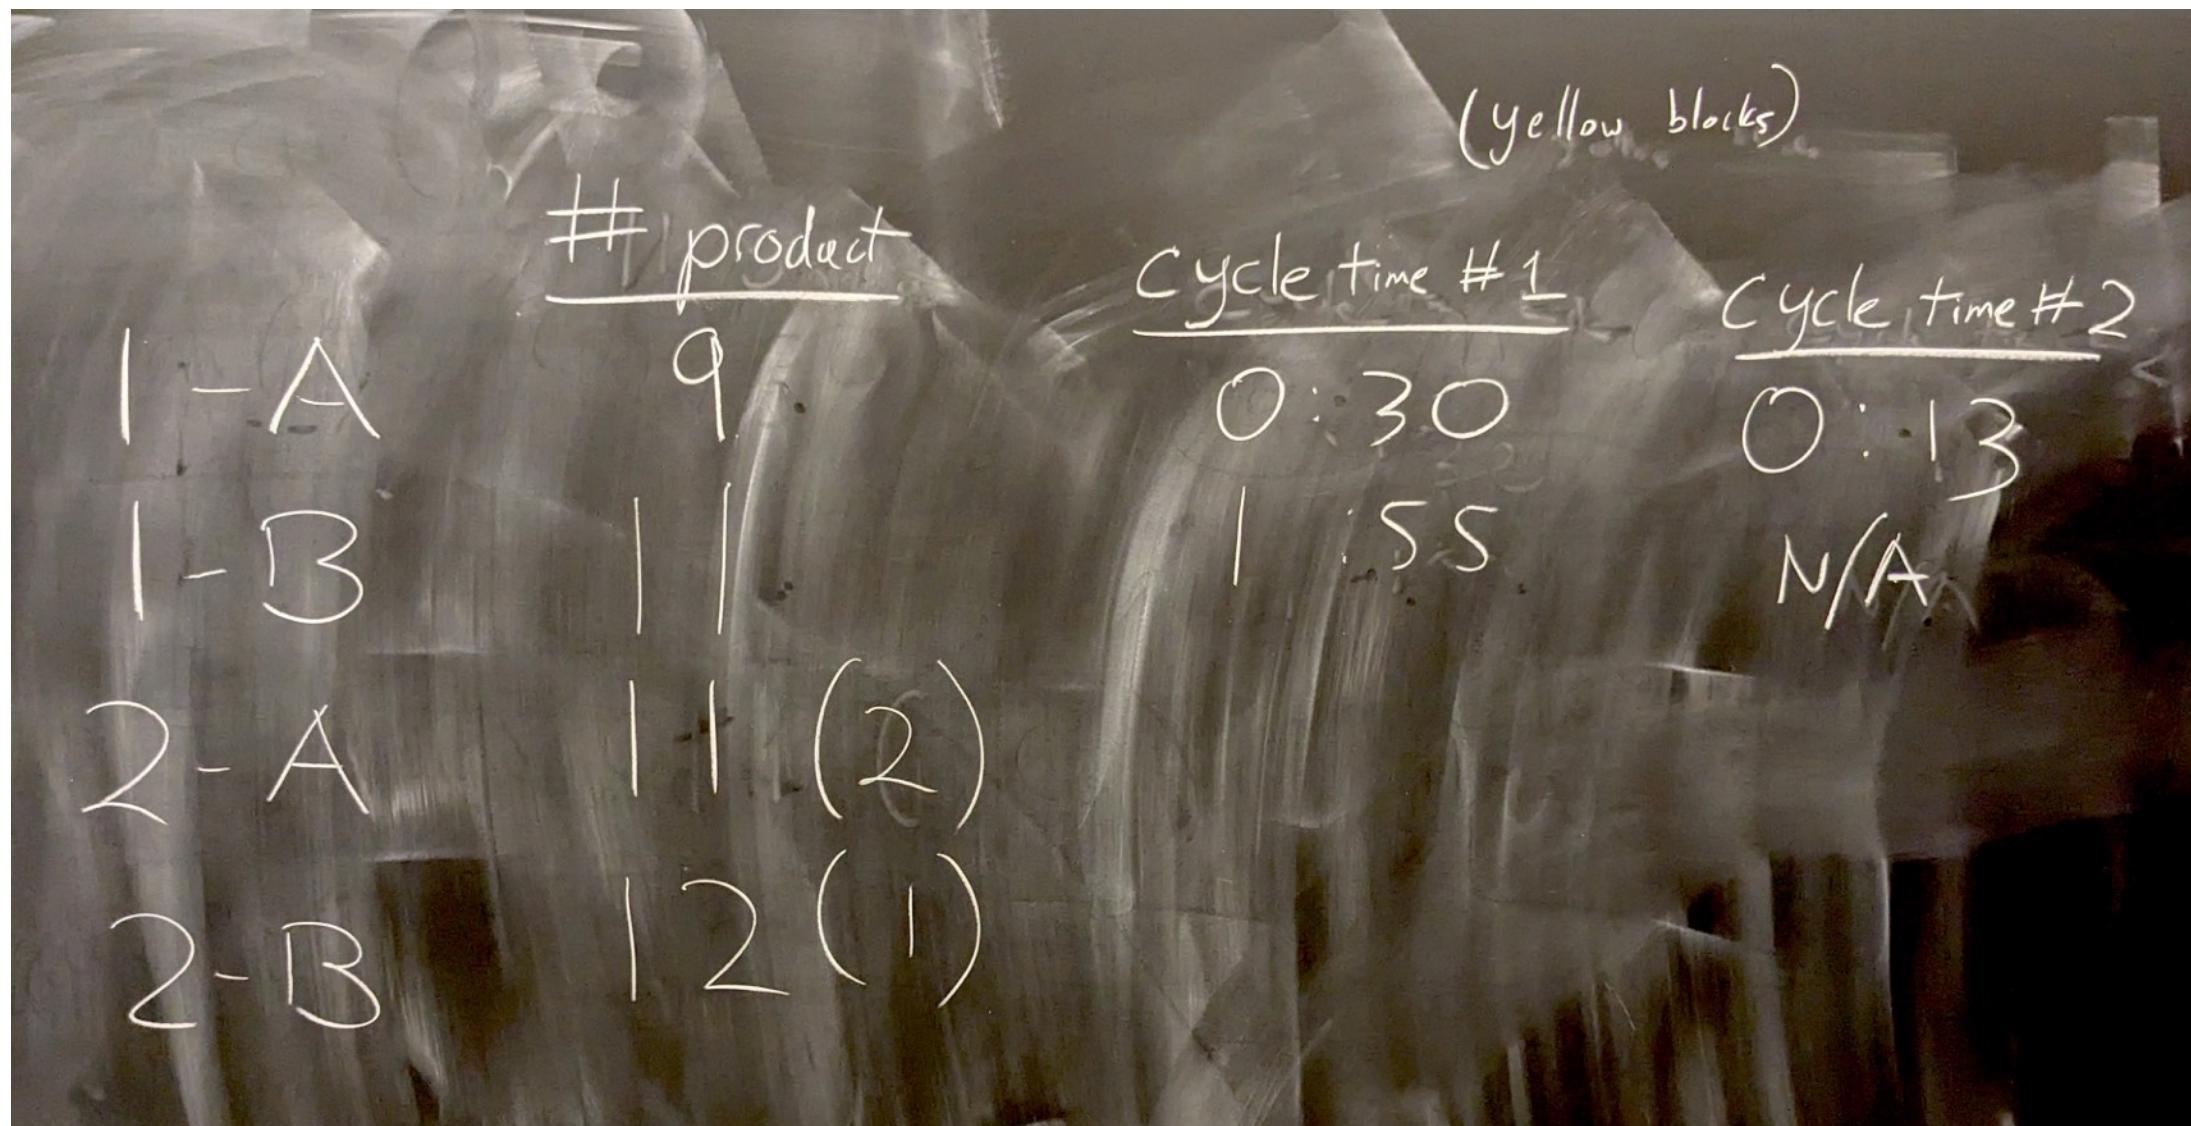

Manufacturing Systems III

System Design and Simulation #2: Lean Game

2

LEGO Demo

	A. Buffer = 2	B. Buffer = 10
Scenario 1 unreliable machines	✓	✓
Scenario 2 detecting defects	✓	✓

Rules

- assemble at a **consistent rate**
- no pre-building
- M1 stops when buffer is full
- M2 can only build with parts from the buffer

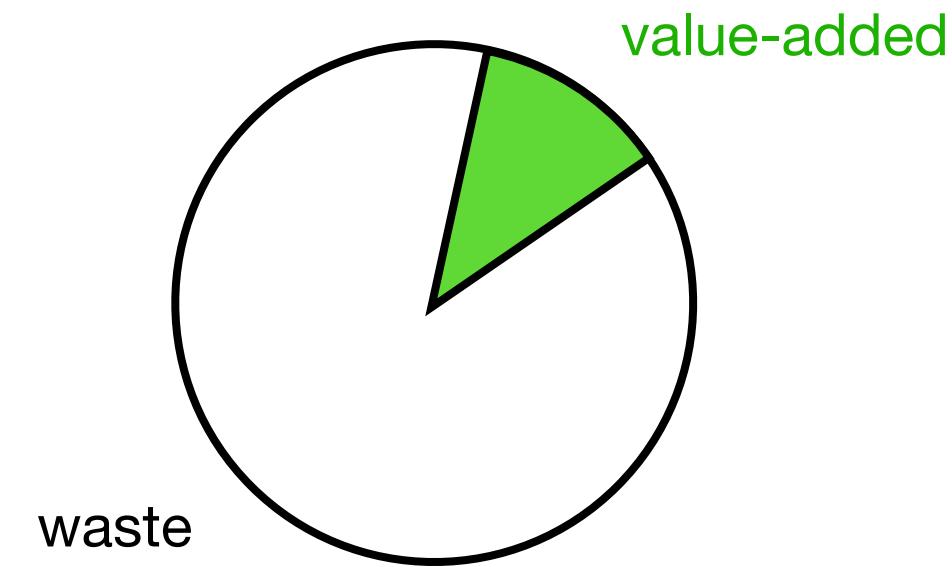

Manufacturing Systems II

System Considerations: Layouts and Production Rates

3

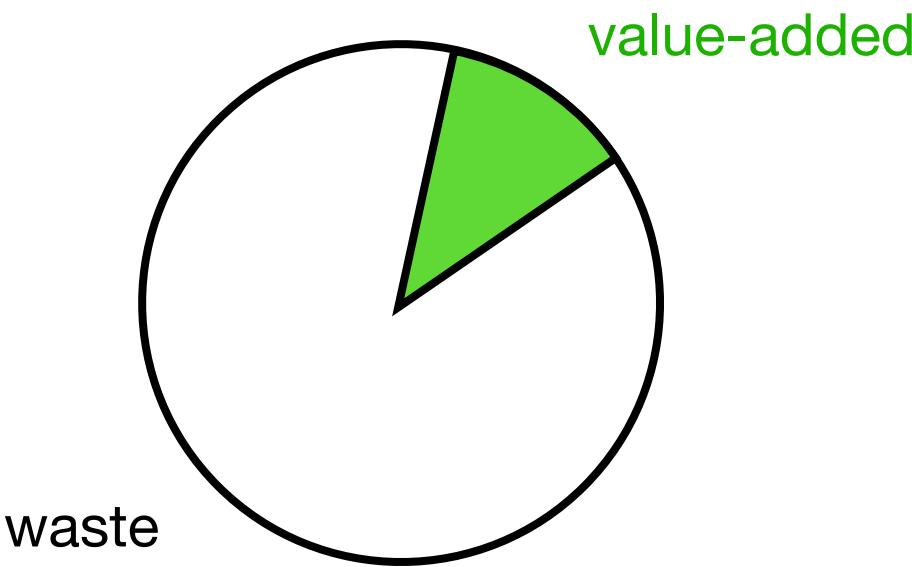

Different Types of Efficiency/Productivity

People **Students**

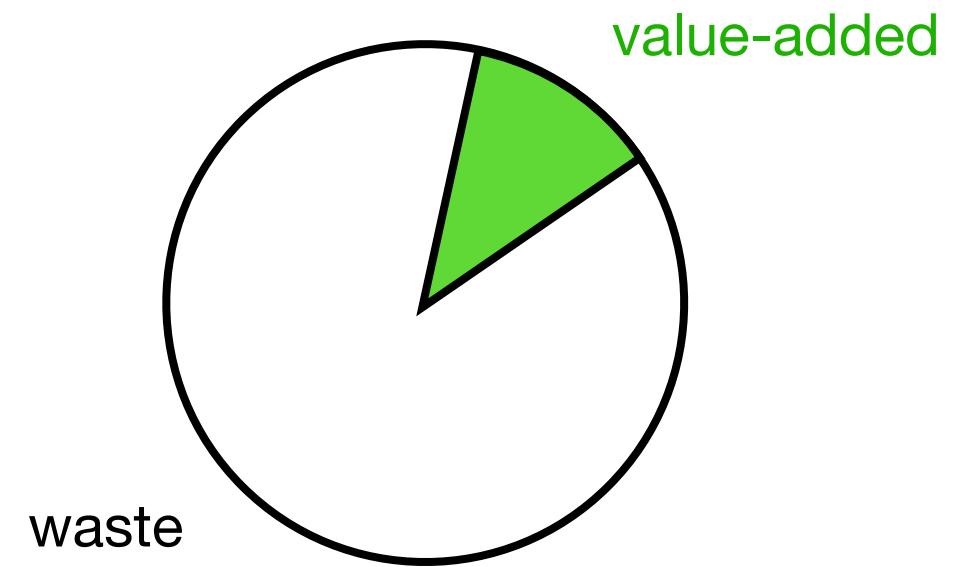

engaged in producing/assembling
learning
watching machine running
producing defects
looking for tools
fixing machine breakdowns
producing unnecessary items

Materials

being transformed into parts
being transported
sitting in storage/buffers
being inspected
getting reworked

Machines

transforming parts
unnecessary movements
being set up
being broken down
producing defecting parts
producing parts that are not needed

plant manager: tries to maximize utilization of resources (Toyota: squeezing water out of dry towels)

Manufacturing Systems II

System Considerations: Layouts and Production Rates

4

Production Rate

increases if:

- disruptions are reduced
- increase rate of slowest machine (bottleneck)
- introduce **buffers** appropriately

Negative Effects of Buffers (Inventory/Work in Process)

- storage costs money (space, management, etc)
- cycle time (time in system) increases
 - takes longer to detect defects
- products can become obsolete/shrink

Manufacturing Systems III

System Design and Simulation #2: Lean Game

Typical Design Guidelines

Line Balancing (Case IV)

Short Cycle Time (Case II, V)

- minimum disruptions (Case II, V)
- optimum WIP (Case VI)
- minimum material handling (Case I)
- batch vs one piece

Fast Feedback

Minimum Demand Lumpiness

	# Machines	Reliability	Operation Times	Buffers
Case I	1	✓	same	✗
Case II	1	✗	same	✗
Case III	2+	✓	same	✗
Case IV	2+	✓	different	✗
Case V	2+	✗	same	✗
Case VI	2+	✗	same	✓

Manufacturing Systems III

System Design and Simulation #2: Lean Game

Typical Design Guidelines

Line Balancing (Case IV)

Short Cycle Time (Case II, V)

- minimum disruptions (Case II, V)
- optimum WIP (Case VI)
- minimum material handling (Case I)
- batch vs one piece

Fast Feedback

Minimum Demand Lumpiness

	# Machines	Reliability	Operation Times	Buffers
Case I	1	✓	same	✗
Case II	1	✗	same	✗
Case III	2+	✓	same	✗
Case IV	2+	✓	different	✗
Case V	2+	✗	same	✗
Case VI	2+	✗	same	✓

Manufacturing Systems III

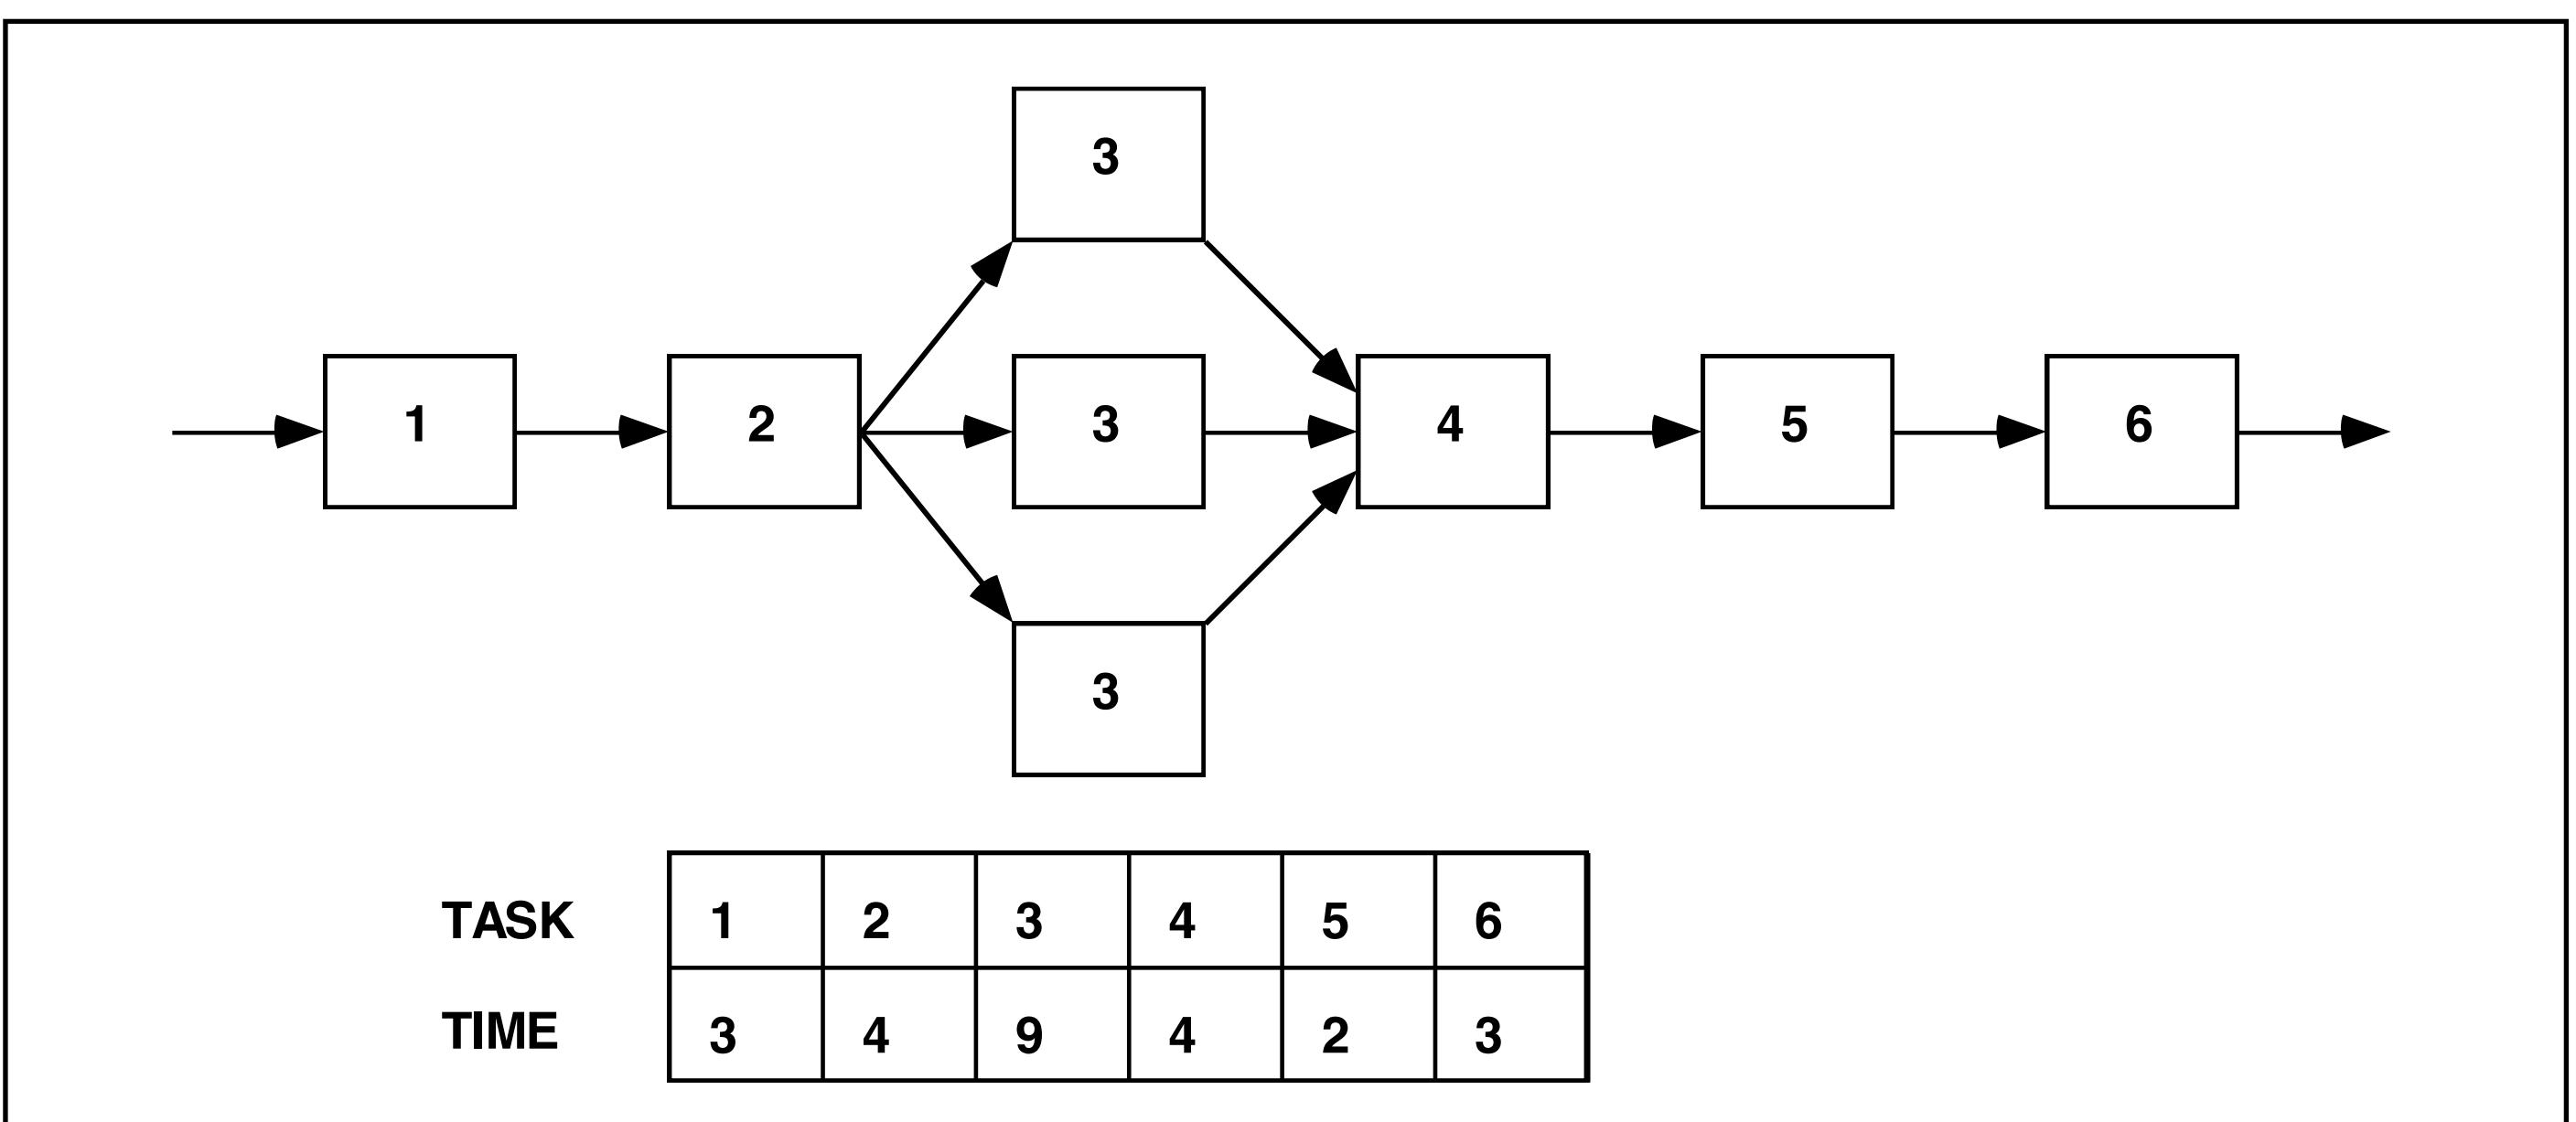

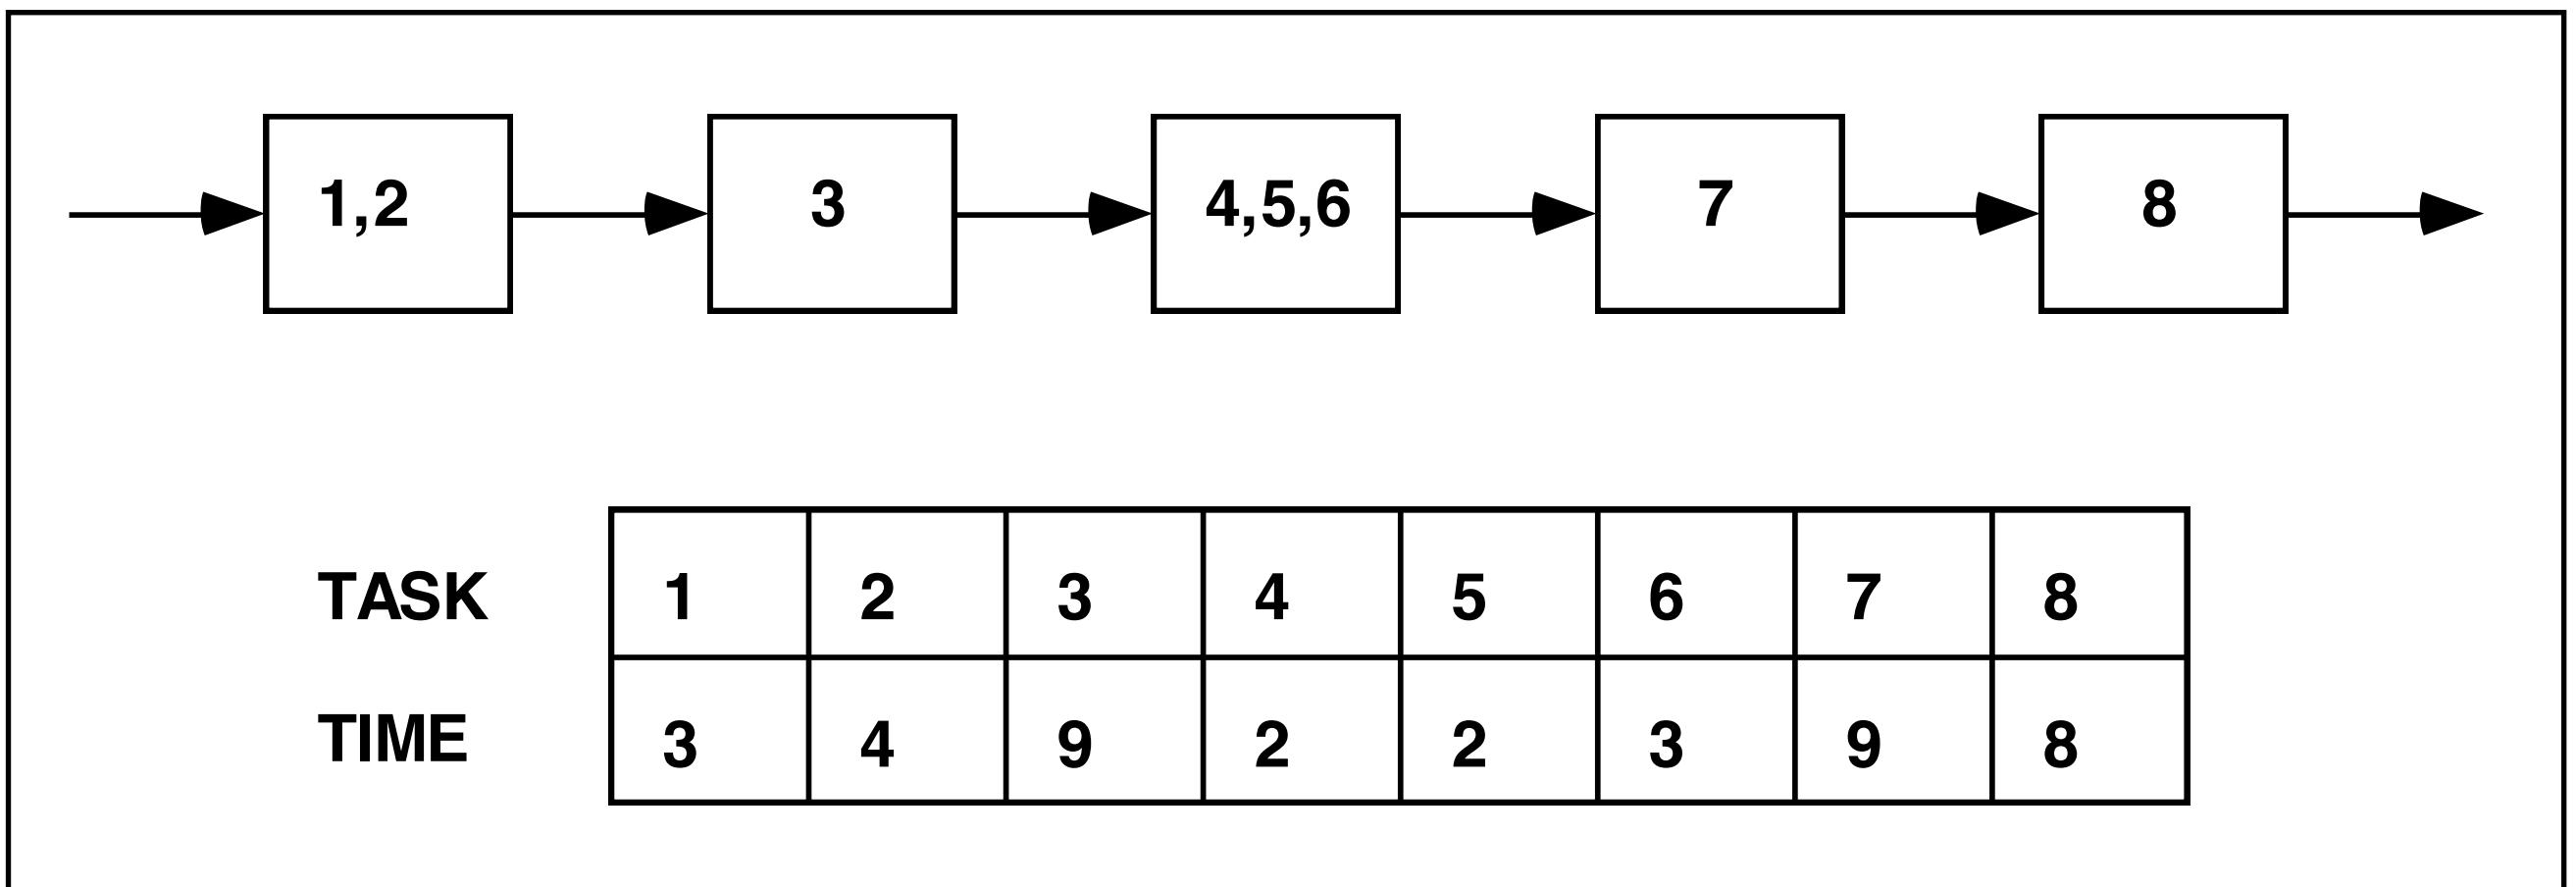

System Design and Simulation #2: Lean Game

7

Line Balancing

what can you do to balance the line?

- break slow steps into multiple serial steps
 - evenly distribute the workload
- break slow steps into parallel stations

Manufacturing Systems III

System Design and Simulation #2: Lean Game

Typical Design Guidelines

Line Balancing (Case IV)

Short Cycle Time

- minimum disruptions (Case II, V, VI)
- optimum WIP (Case VI)
- minimum material handling
- batch vs one piece

Fast Feedback

Minimum Demand Lumpiness

	# Machines	Reliability	Operation Times	Buffers
Case I	1	✓	same	✗
Case II	1	✗	same	✗
Case III	2+	✓	same	✗
Case IV	2+	✓	different	✗
Case V	2+	✗	same	✗
Case VI	2+	✗	same	✓

Manufacturing Systems III

System Design and Simulation #2: Lean Game

9

Cycle Time

“the time a part spends in the system”

- used in multiple different ways in different places: you have to ask!

Little's Law

$$L = \lambda w$$

L: total inventory levels

λ : system production rate

w: total waiting time (time for one part to get through the full system)

$$w = \frac{L}{\lambda}$$

Manufacturing Systems III

System Design and Simulation #2: Lean Game

10

Typical Design Guidelines

Line Balancing (Case IV)

Short Cycle Time

- minimum disruptions (Case II, V, VI)
- optimum WIP (Case VI)
- minimum material handling
- batch vs one piece

Fast Feedback

Minimum Demand Lumpiness

	# Machines	Reliability	Operation Times	Buffers
Case I	1	✓	same	✗
Case II	1	✗	same	✗
Case III	2+	✓	same	✗
Case IV	2+	✓	different	✗
Case V	2+	✗	same	✗
Case VI	2+	✗	same	✓

Manufacturing Systems III

System Design and Simulation #2: Lean Game

11

Batching

Operation time, τ : 3 minutes

Batch (lot) size: 1,000

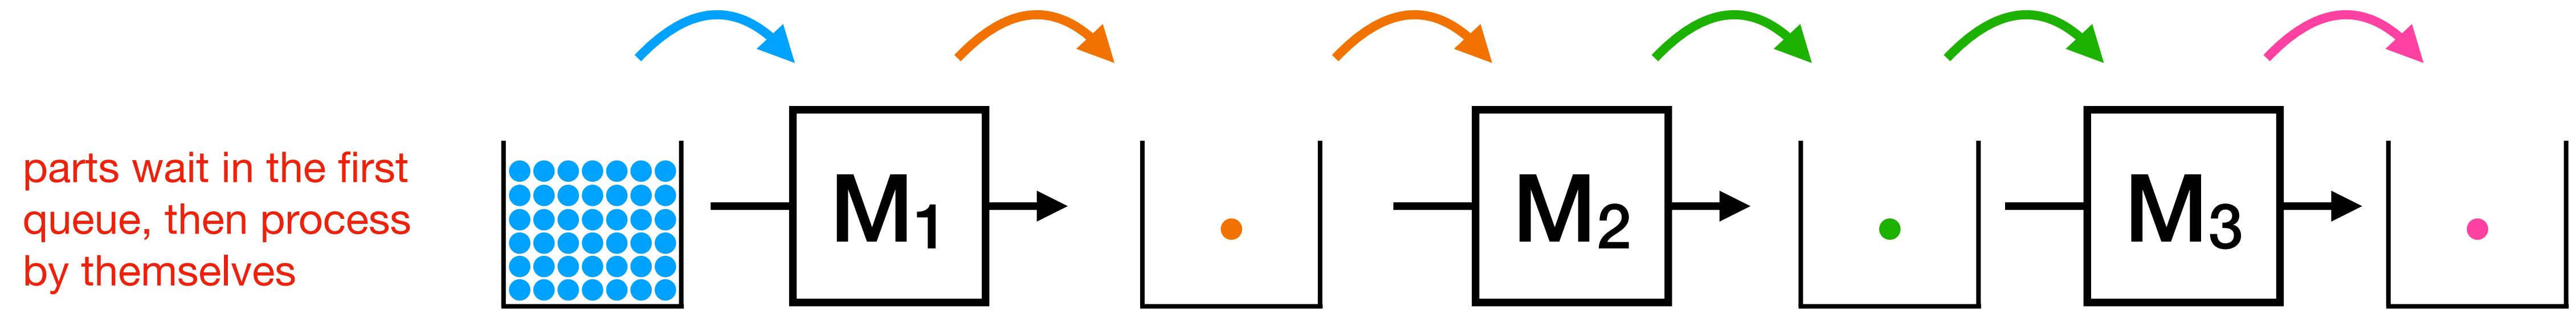

Cycle time: $1,000 * 3\text{min} + 1,000 * 3\text{min} + 1,000 * 3\text{min} = 9,000\text{min}$

Manufacturing Systems III

System Design and Simulation #2: Lean Game

12

Single Piece Flow

Operation time, τ : 3 minutes

Batch (lot) size: 1

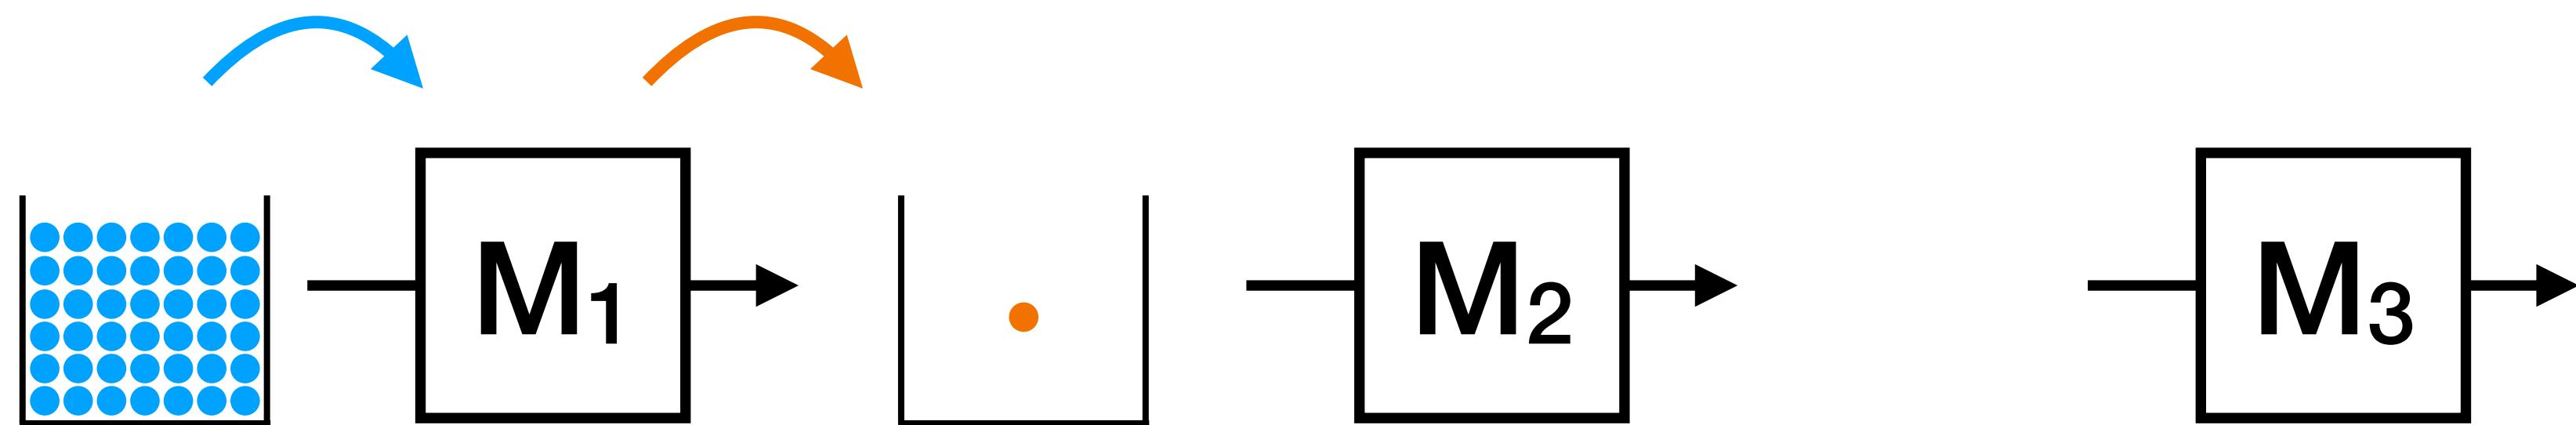

Cycle time: $1,000 * 3\text{min} + 2 * 3\text{min} = 3,006\text{min}$

Manufacturing Systems III

System Design and Simulation #2: Lean Game

13

Single Piece Flow

Operation time, τ : 3 minutes

Batch (lot) size: 1

Cycle time: $1,000 * 3\text{min} + 2 * 3\text{min} = 3,006\text{min}$

Manufacturing Systems III

System Design and Simulation #2: Lean Game

14

Cycle Time vs Operation Time vs Takt Time vs Lead Time

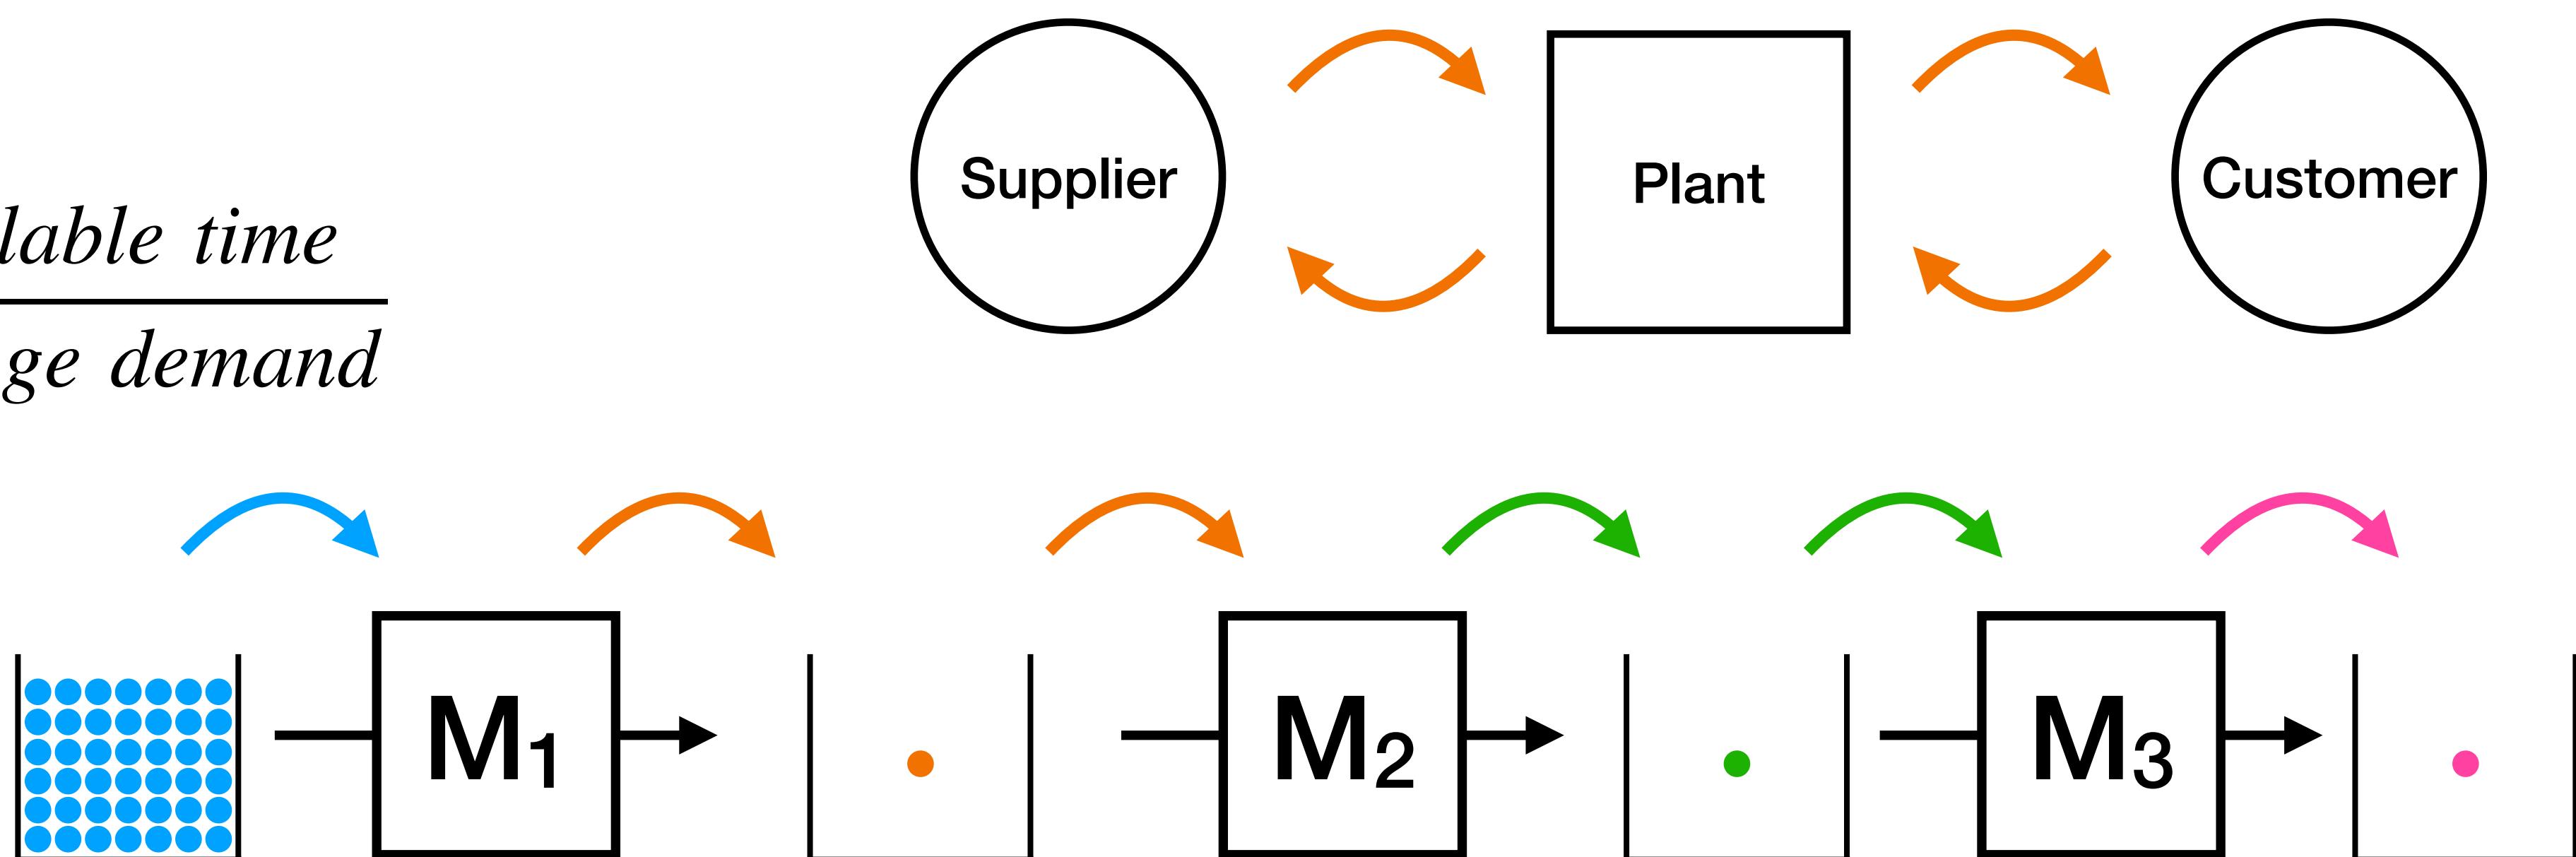

cycle time: the time a part spends in the whole system

operation time: the time a part spends at a station being transformed (process time)

Takt time: the time between finished parts needed to meet customer demand

lead time: the time between ordering and delivery of parts/materials/supplies

$$Takt\ time = \frac{daily\ available\ time}{daily\ average\ demand}$$

Manufacturing Systems III

System Design and Simulation #2: Lean Game

15

Cycle Time vs Operation Time vs Takt Time vs Lead Time

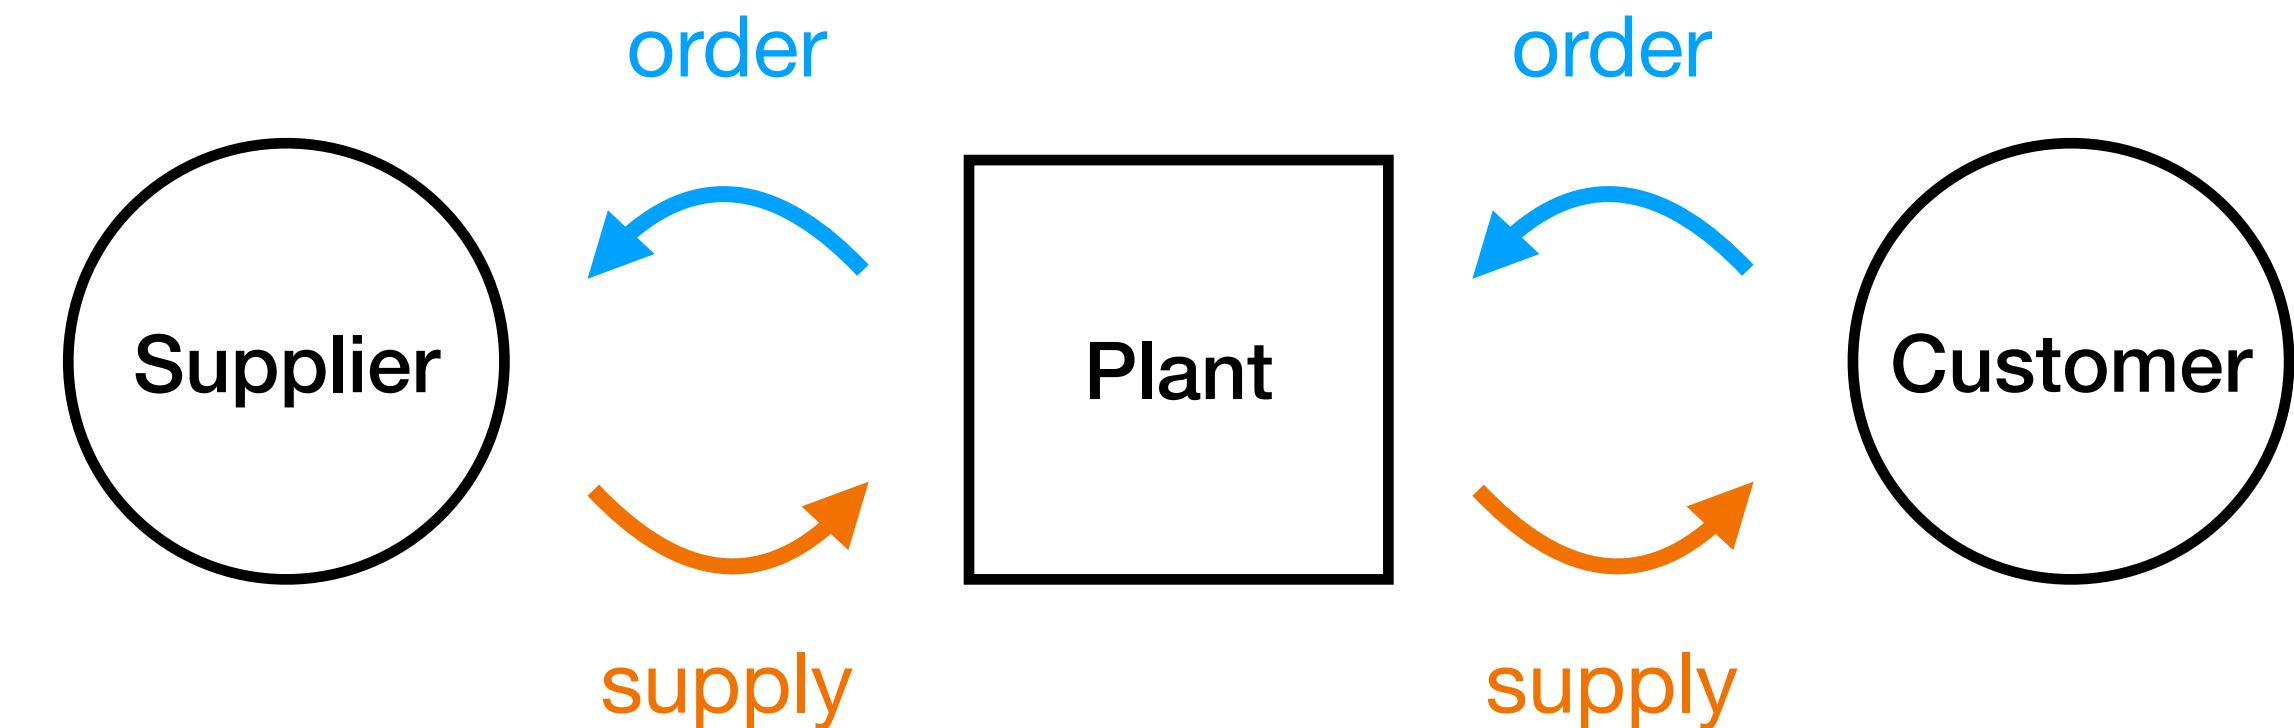

cycle time: the time a part spends in the whole system

operation time: the time a part spends at a station being transformed (process time)

Takt time: the time between finished parts needed to meet customer demand

lead time: the time between ordering and delivery of parts/materials/supplies

$$Takt\ time = \frac{daily\ available\ time}{daily\ average\ demand}$$

Manufacturing Systems III

System Design and Simulation #2: Lean Game

16

Typical Design Guidelines

Line Balancing (Case IV)

Short Cycle Time

- minimum disruptions (Case II, V, VI)
- optimum WIP (Case VI)
- minimum material handling
- batch vs one piece

Fast Feedback

Minimum Demand Lumpiness

"I didn't have any visibility on future demand."

"I ordered more to ensure a safe level of stock."

"My supplier didn't deliver so I increased my orders."

"I was afraid that I wouldn't have enough stock."

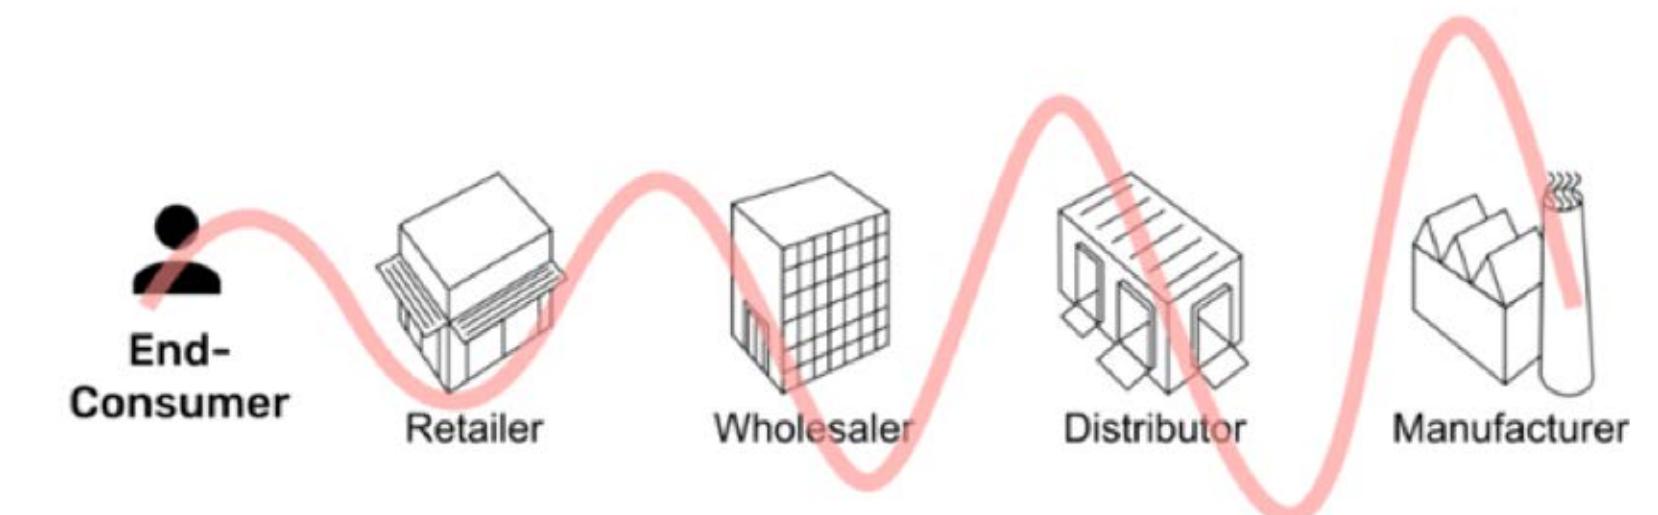

"I started to have backorders so I increased my orders to be safe."

"My customer suddenly increased his orders."

"The Lead Time didn't allow me to react quickly enough."

"I tried to optimize my own stock."

"I lost count of how much I had ordered before."

what was needed to prevent propagation?

Manufacturing Systems III

System Design and Simulation #2: Lean Game

17

Resource Planning + Material Flow

many different planning methodologies

- same aim: improve communication

issue: forecasting is not always accurate

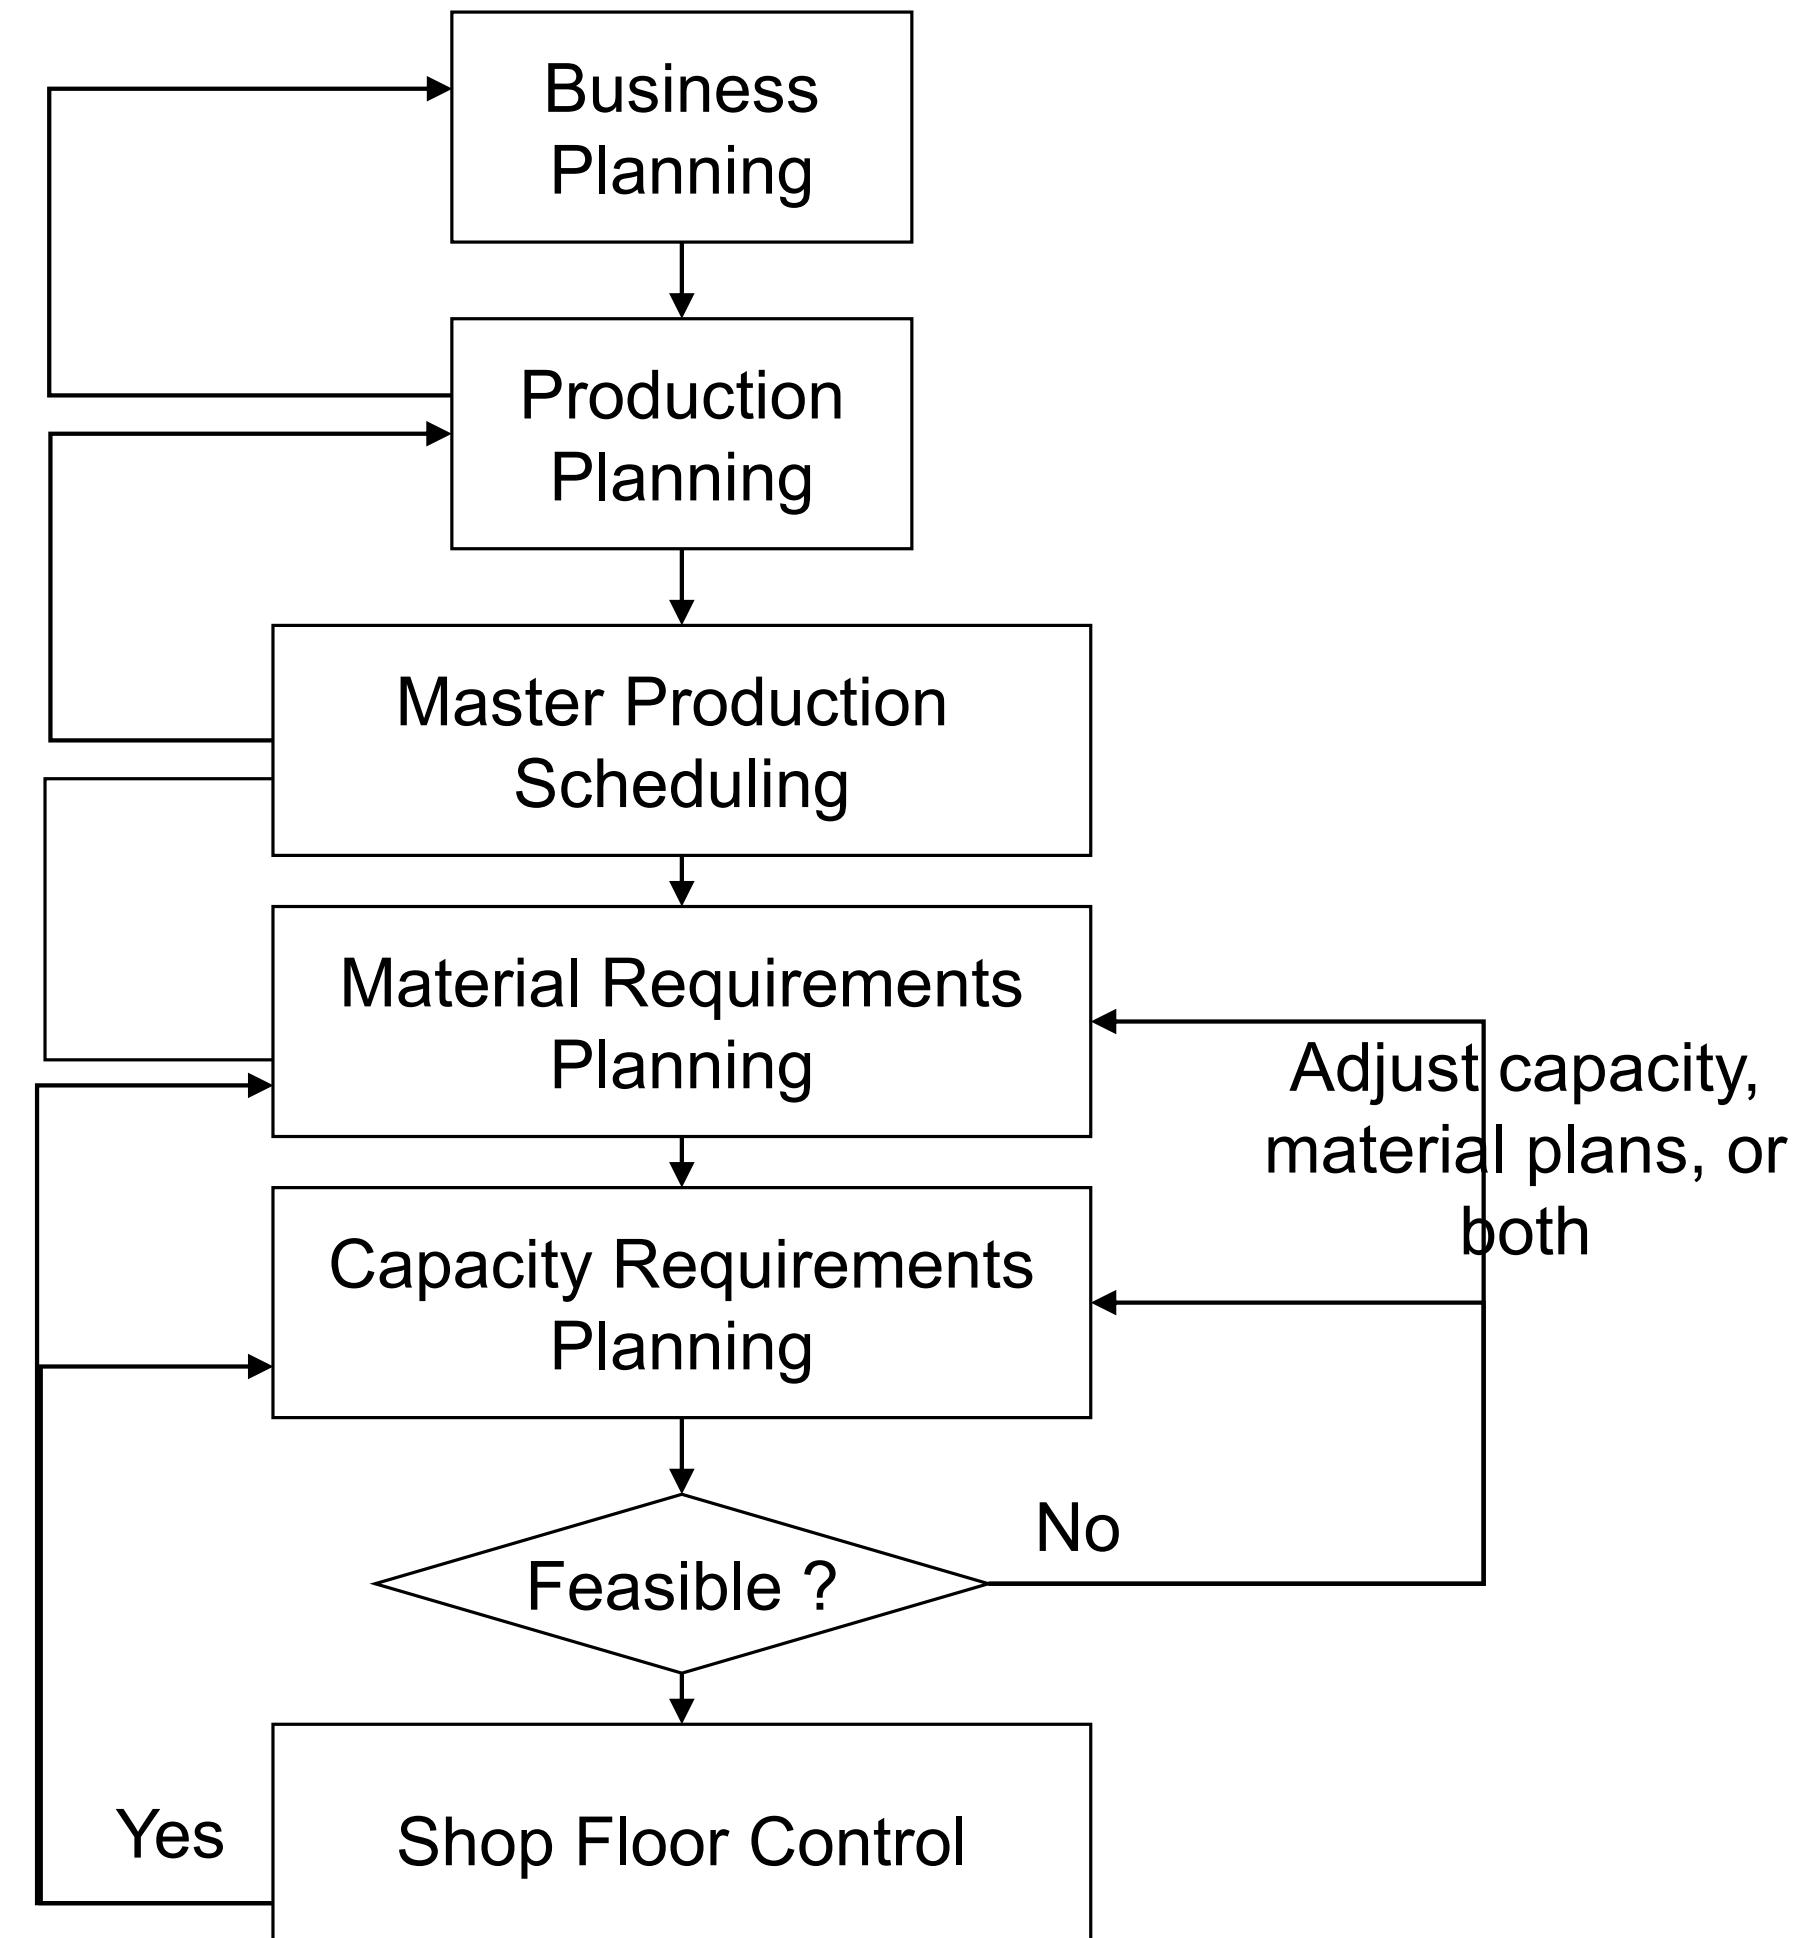

- leads to **backorders** or **inventory** (investment)

Iterate between these two plans until both are in agreement

Iterate between these two plans until both are in agreement

Iterate between these two plans until both are in agreement

Keep operational planning systems informed of progress

Manufacturing Systems III

System Design and Simulation #2: Lean Game

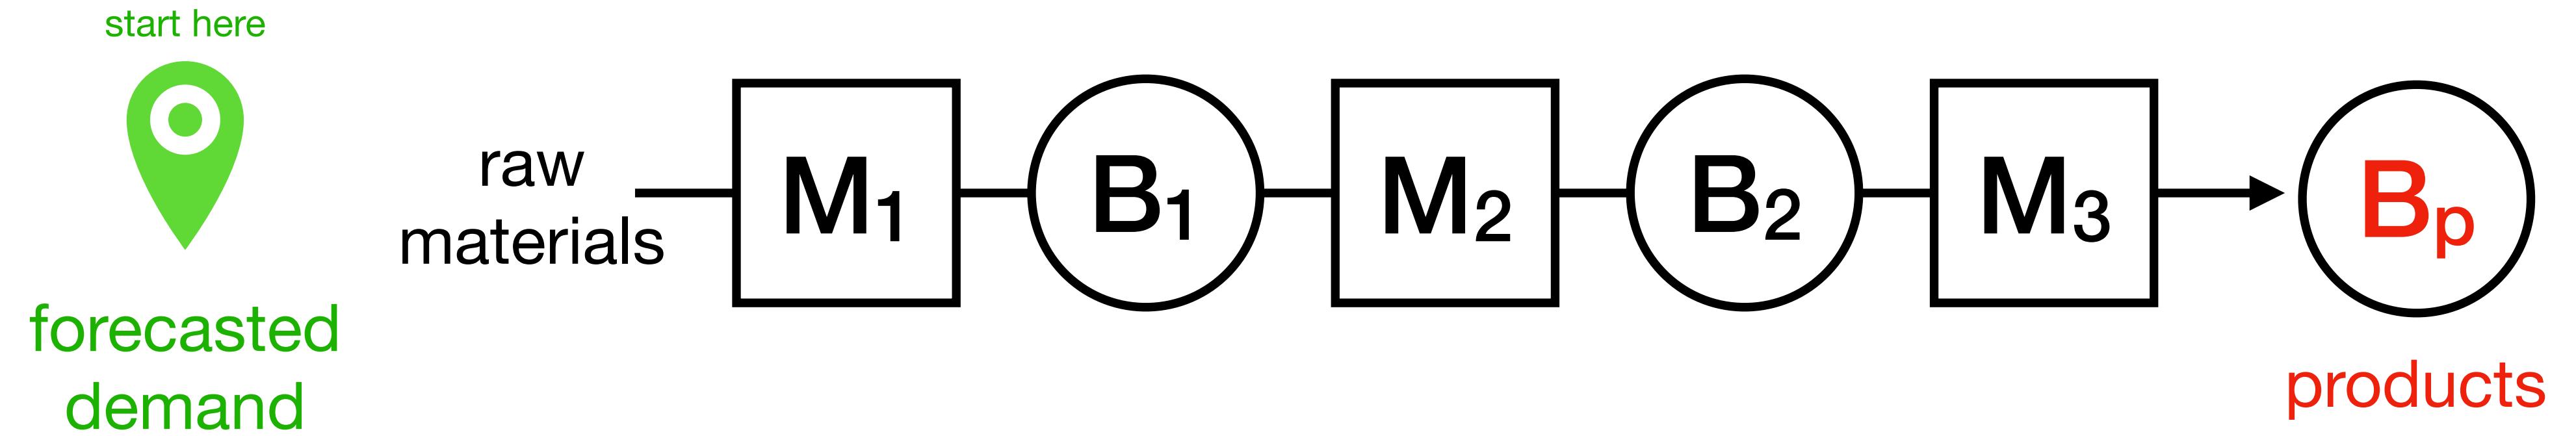

18

Push vs Pull System

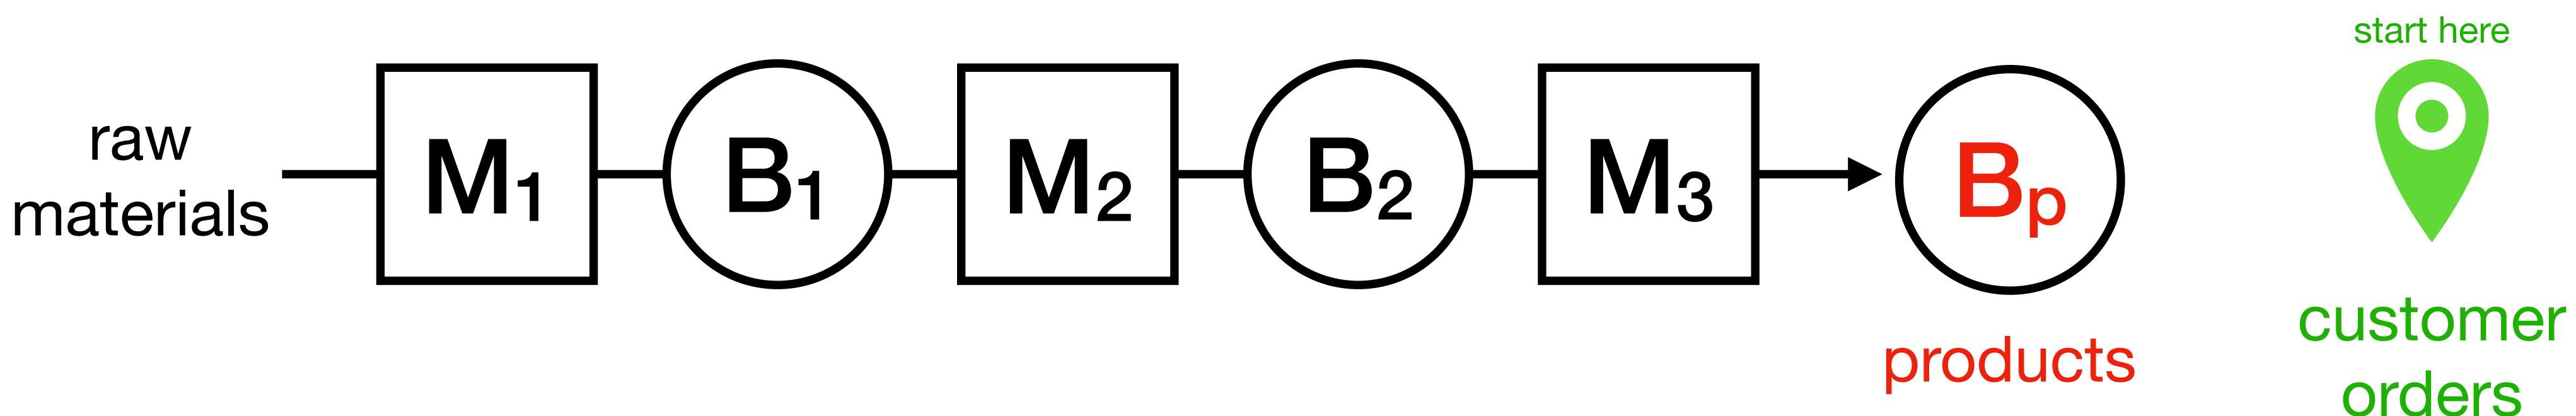

push: forecast demand, make what is predicted, store what is not purchased

which is best?

some of both

pull: take orders from customer, send signal up chain, only produce what will be delivered (Kanban, lean, just-in-time)

Manufacturing Systems III

System Design and Simulation #2: Lean Game

19

Typical Design Guidelines

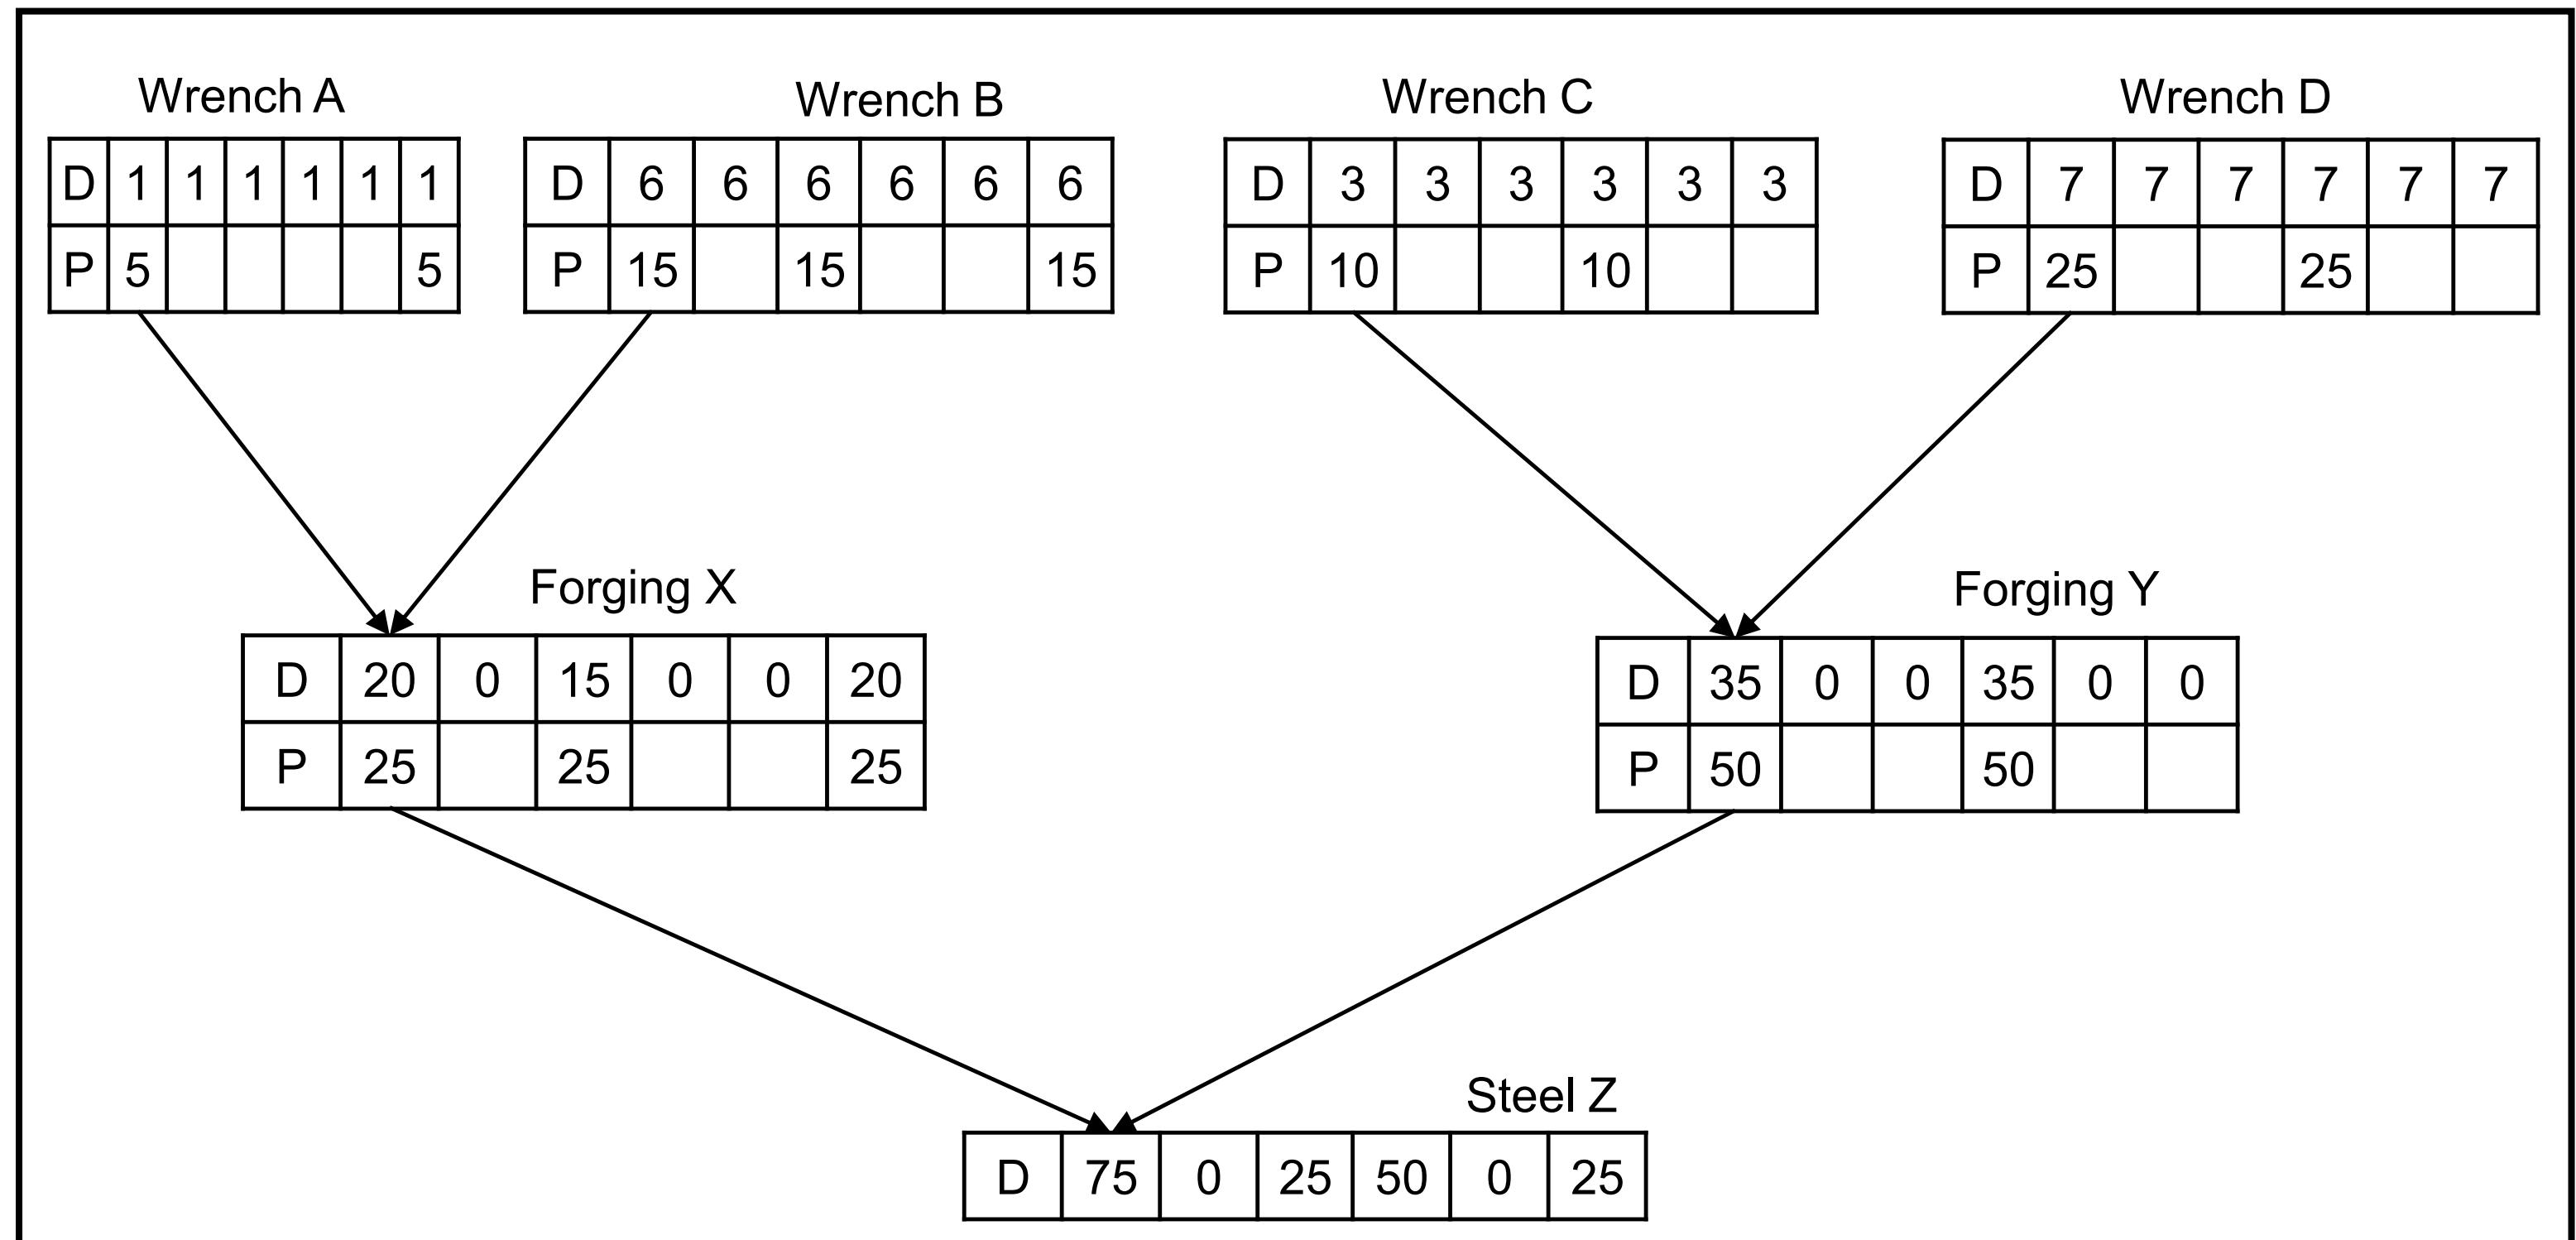

Line Balancing (Case IV)

Short Cycle Time

- minimum disruptions (Case II, V, VI)
- optimum WIP (Case VI)
- minimum material handling
- batch vs one piece

Fast Feedback

Minimum Demand Lumpiness

large variation in demand: high periods and zero periods

- makes forecasting difficult → expensive operations

D: Demand
P: Production

Manufacturing Systems III

System Design and Simulation #2: Lean Game

20

The Lean Game

Welcome Josh!

In this game, you'll be working as an operator in a painting workshop.

Your company logo:  Color Me paintings

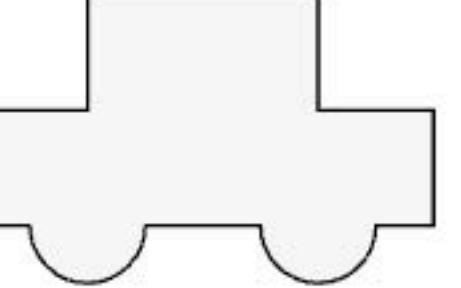

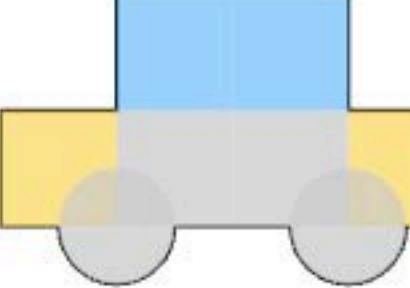

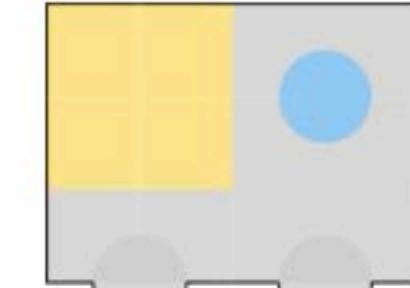

For some time, **Color Me LLC** was the world leader for painted **wooden toys**.
But it is now facing hard worldwide competition.
The customers want faster **deliveries**, reduced **costs** and more **quality**.
If you can't fulfill their needs, the production may be **relocated to more competitive locations!**

*Follow our tutorial to discover the game rules and interface.
The simulation will be reinitialized when it officially starts.*

[Skip](#) [Start Tutorial](#)

Products

Your workshop is painting and selling 2 types of products:

Product name:	Starting raw material:	After the full process:
Car		
Truck		

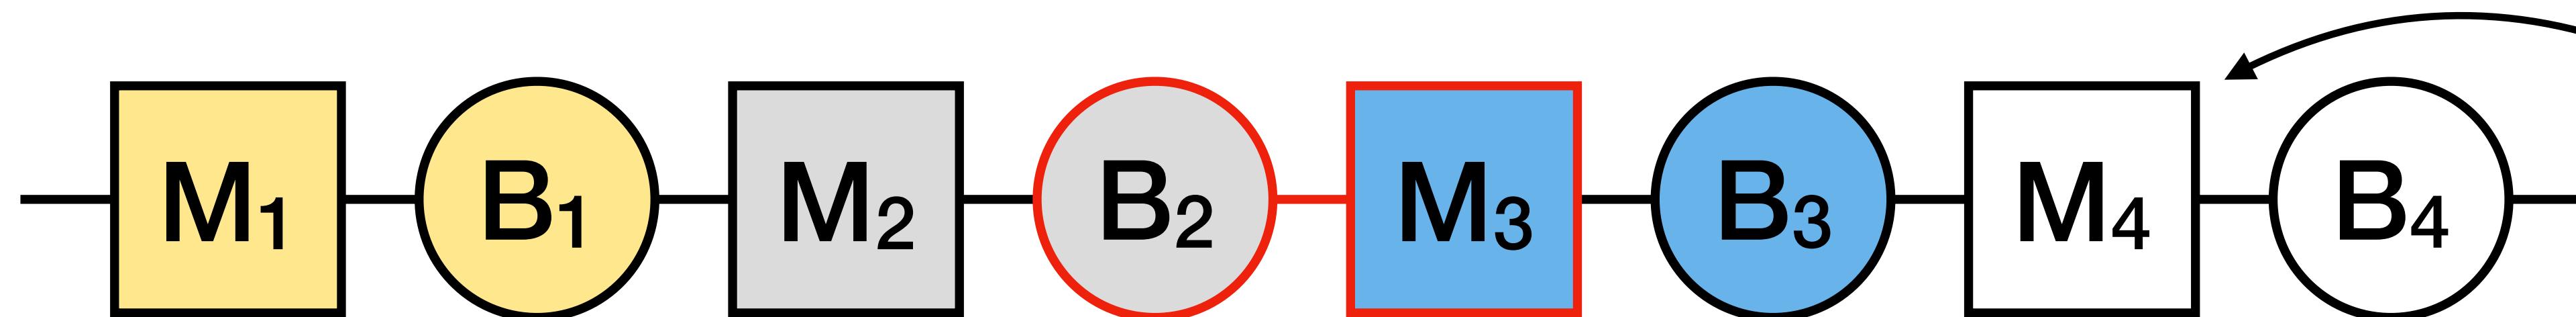

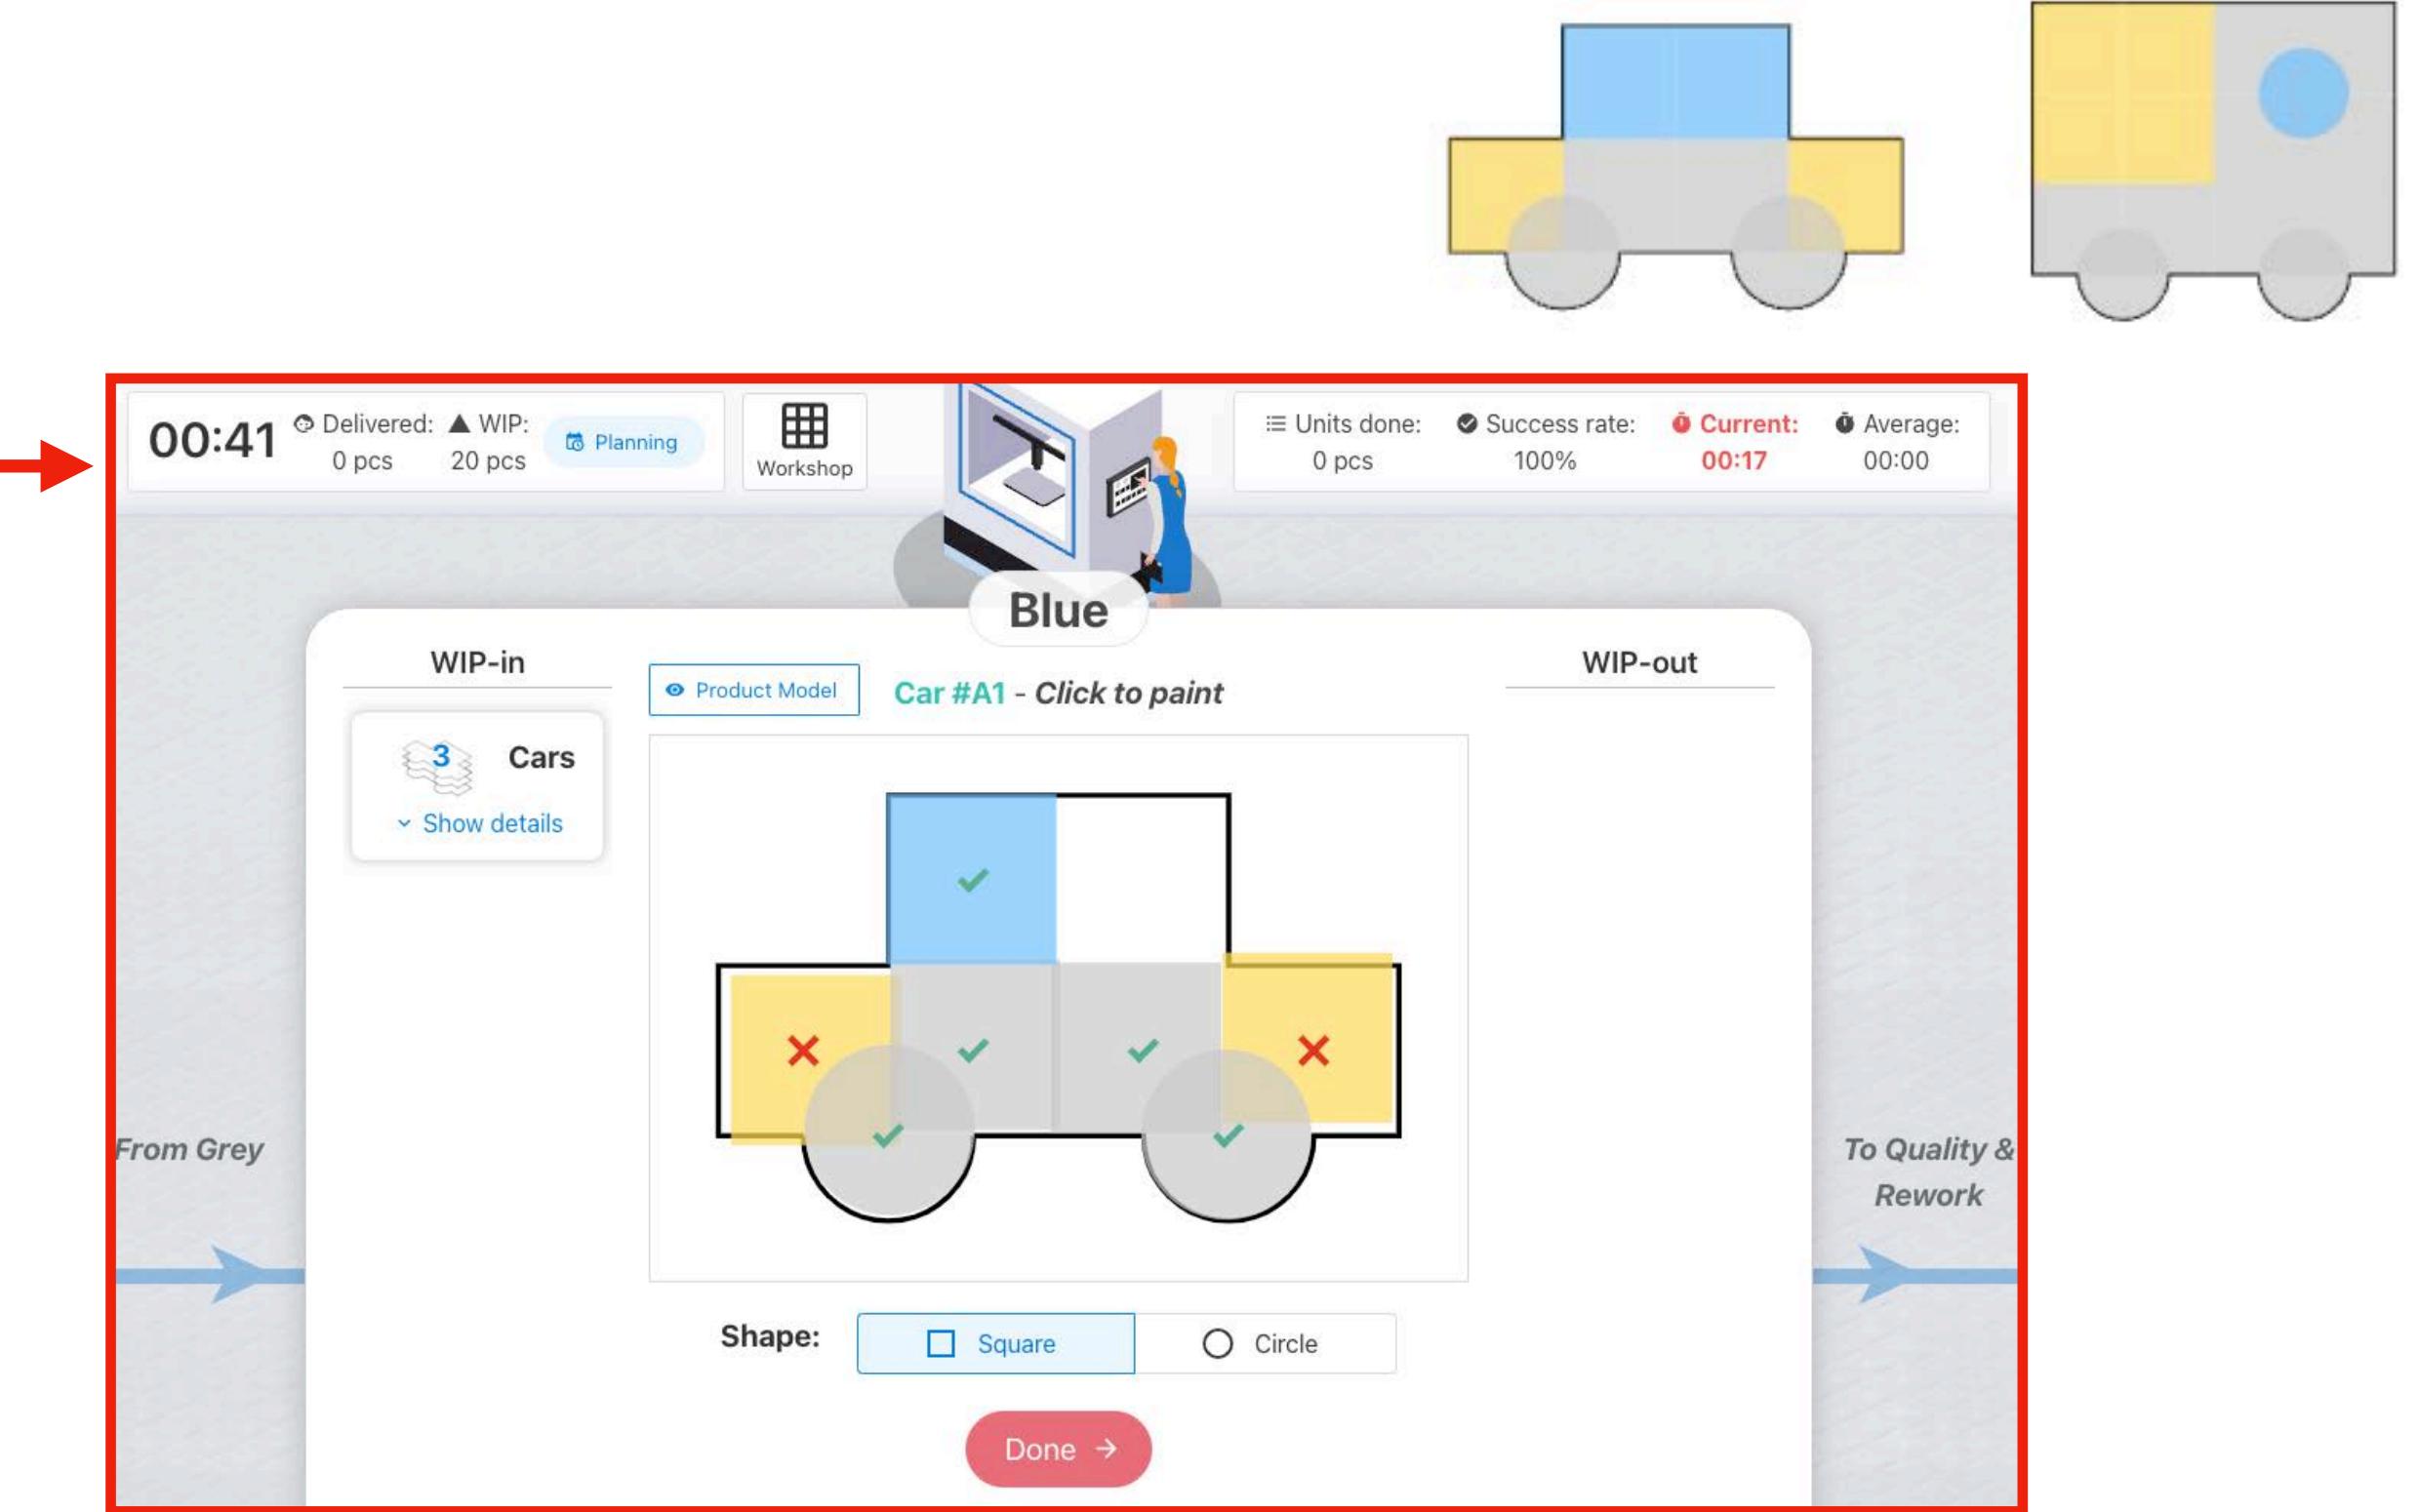

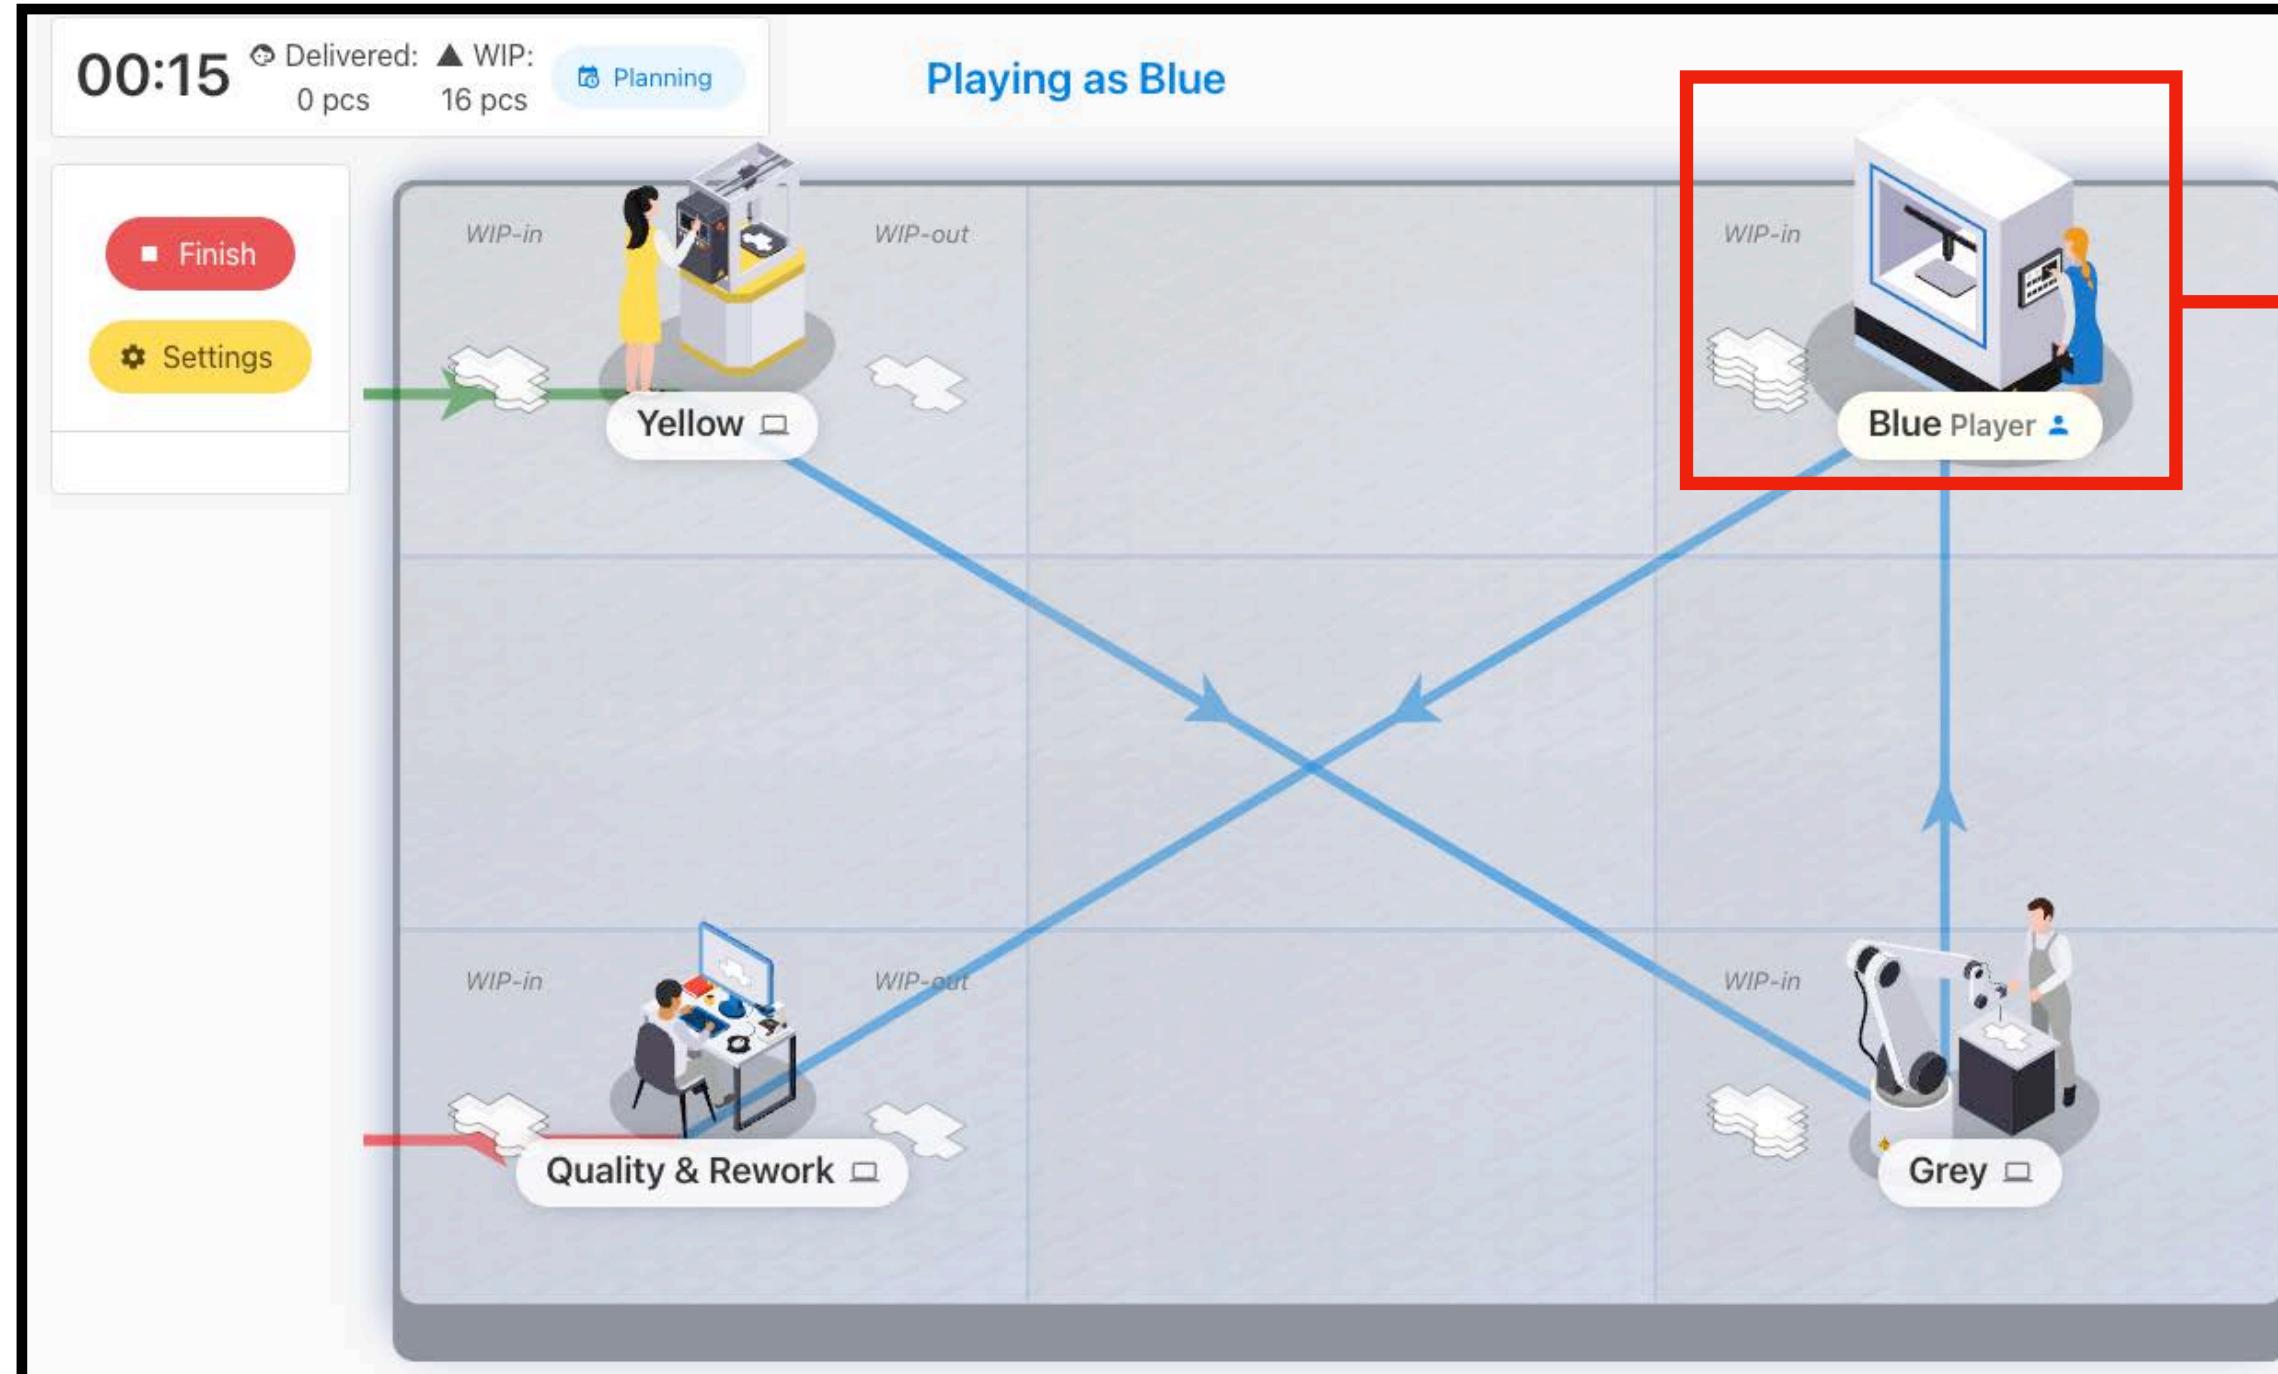

[Back](#) [Next](#)

Manufacturing Systems III

System Design and Simulation #2: Lean Game

21

Game Overview

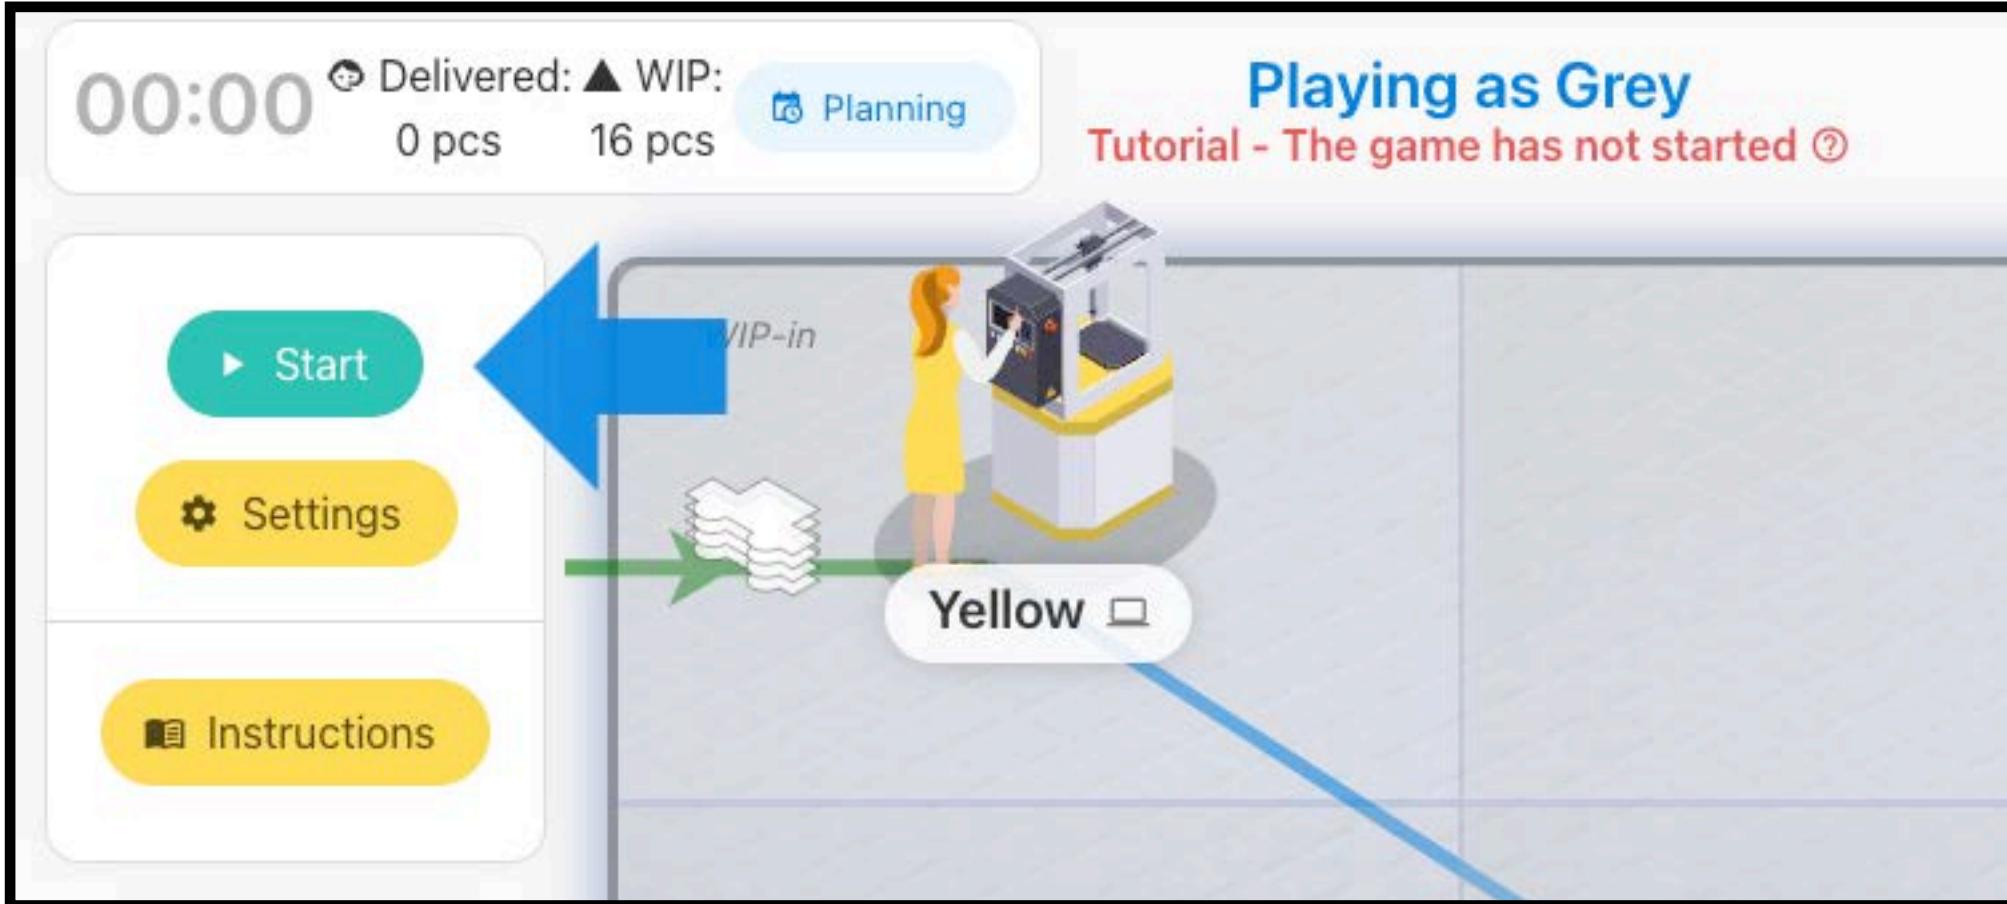

Quality & Rework: can change to any tool, any color, and can remove paint

Manufacturing Systems III

System Design and Simulation #2: Lean Game

22

Game Overview

games will last 6 minutes each

note that you get a tutorial first (for each game)

- if you hit “Start” the tutorial is over

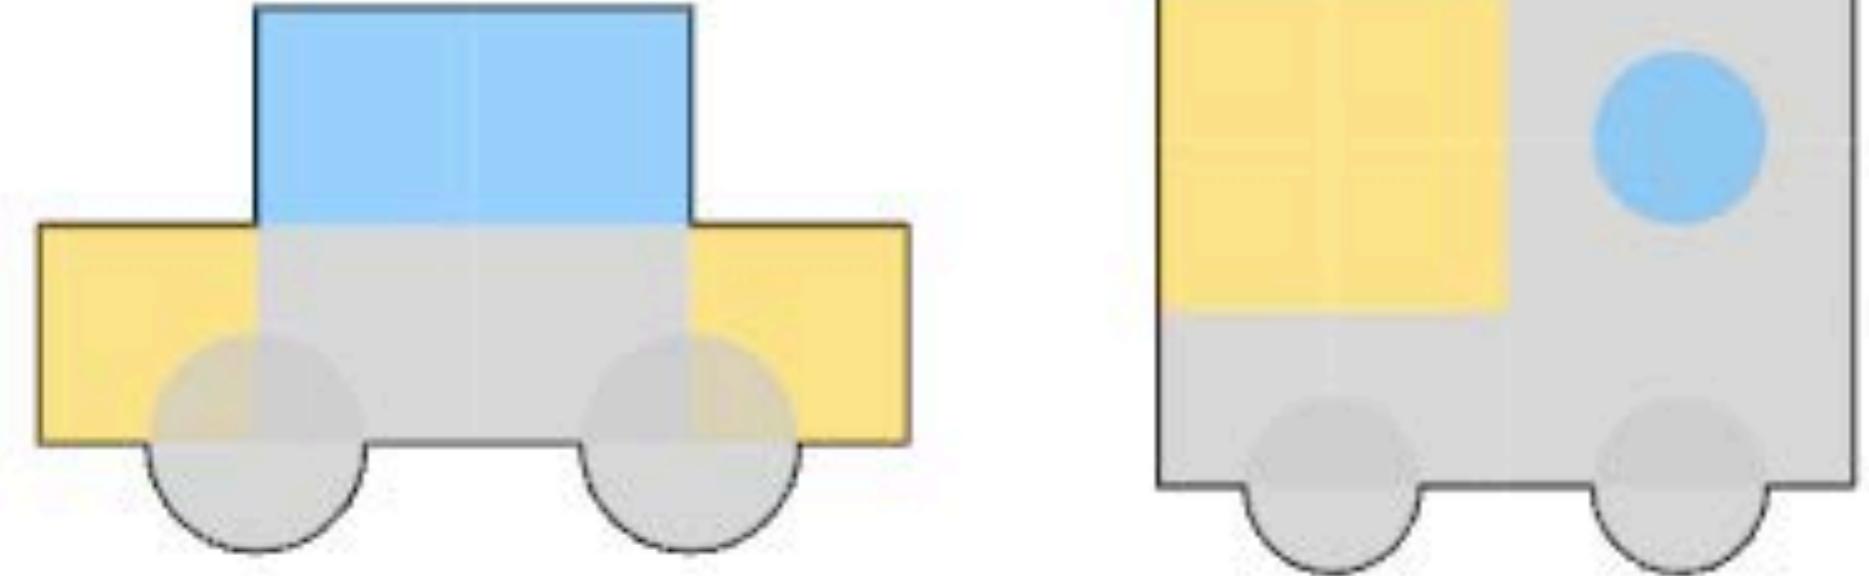

Manufacturing Systems III

System Design and Simulation #2: Lean Game

23

Agenda

1. play [Round 1](#) - Basic Factory (communication encouraged!)
2. understand the results by following the Challenge packet
3. play [Round 2](#) - four “Lean” improvements automatically implemented
4. play [Round 3](#) - all (four more) “Lean” improvements automatically implemented

<https://zensi.mu/1EpA>

	Unit	Qty	Value
Total Revenue <i>All deliveries</i>	+\$100	24	+\$2,400
Labor cost <i>per station</i>	-\$50	4	-\$200
Rework operations <i>per ope</i> (per operation)	-\$5	39	-\$195
WIP Inventory <i>based on avg</i> (avg stock in WIP)	-\$60	21	-\$1,211
Late deliveries <i>per unit</i>	-\$30	8	-\$240
Defective deliveries <i>per unit</i>	-\$50	0	\$0
Total Expenses			-\$1,846
Bottom Line			+\$554

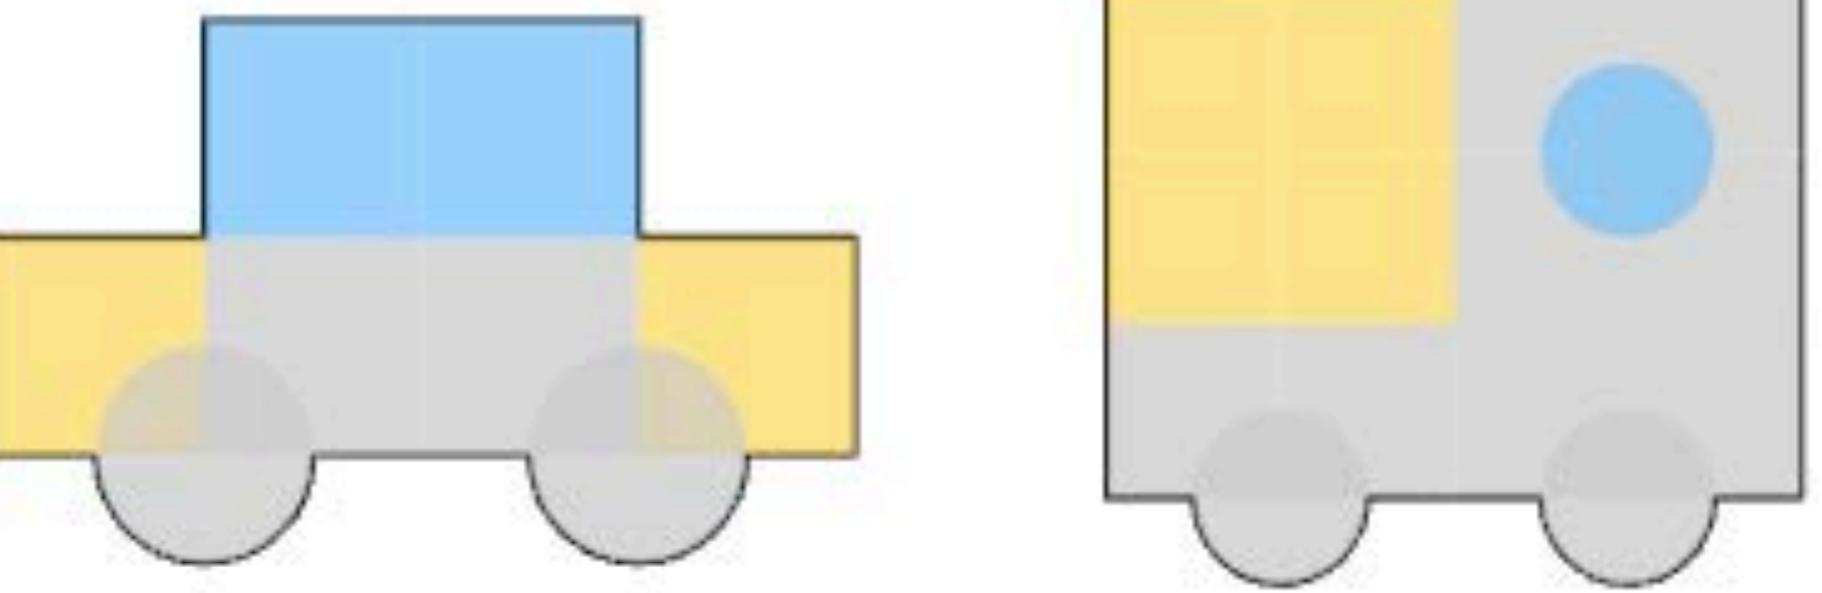

Manufacturing Systems III

System Design and Simulation #2: Lean Game

24

Agenda

1. play [Round 1](#) - Basic Factory (communication encouraged!)
2. understand the results by following the Challenge packet
3. play [Round 2](#) - four “Lean” improvements automatically implemented
4. play [Round 3](#) - all (four more) “Lean” improvements automatically implemented

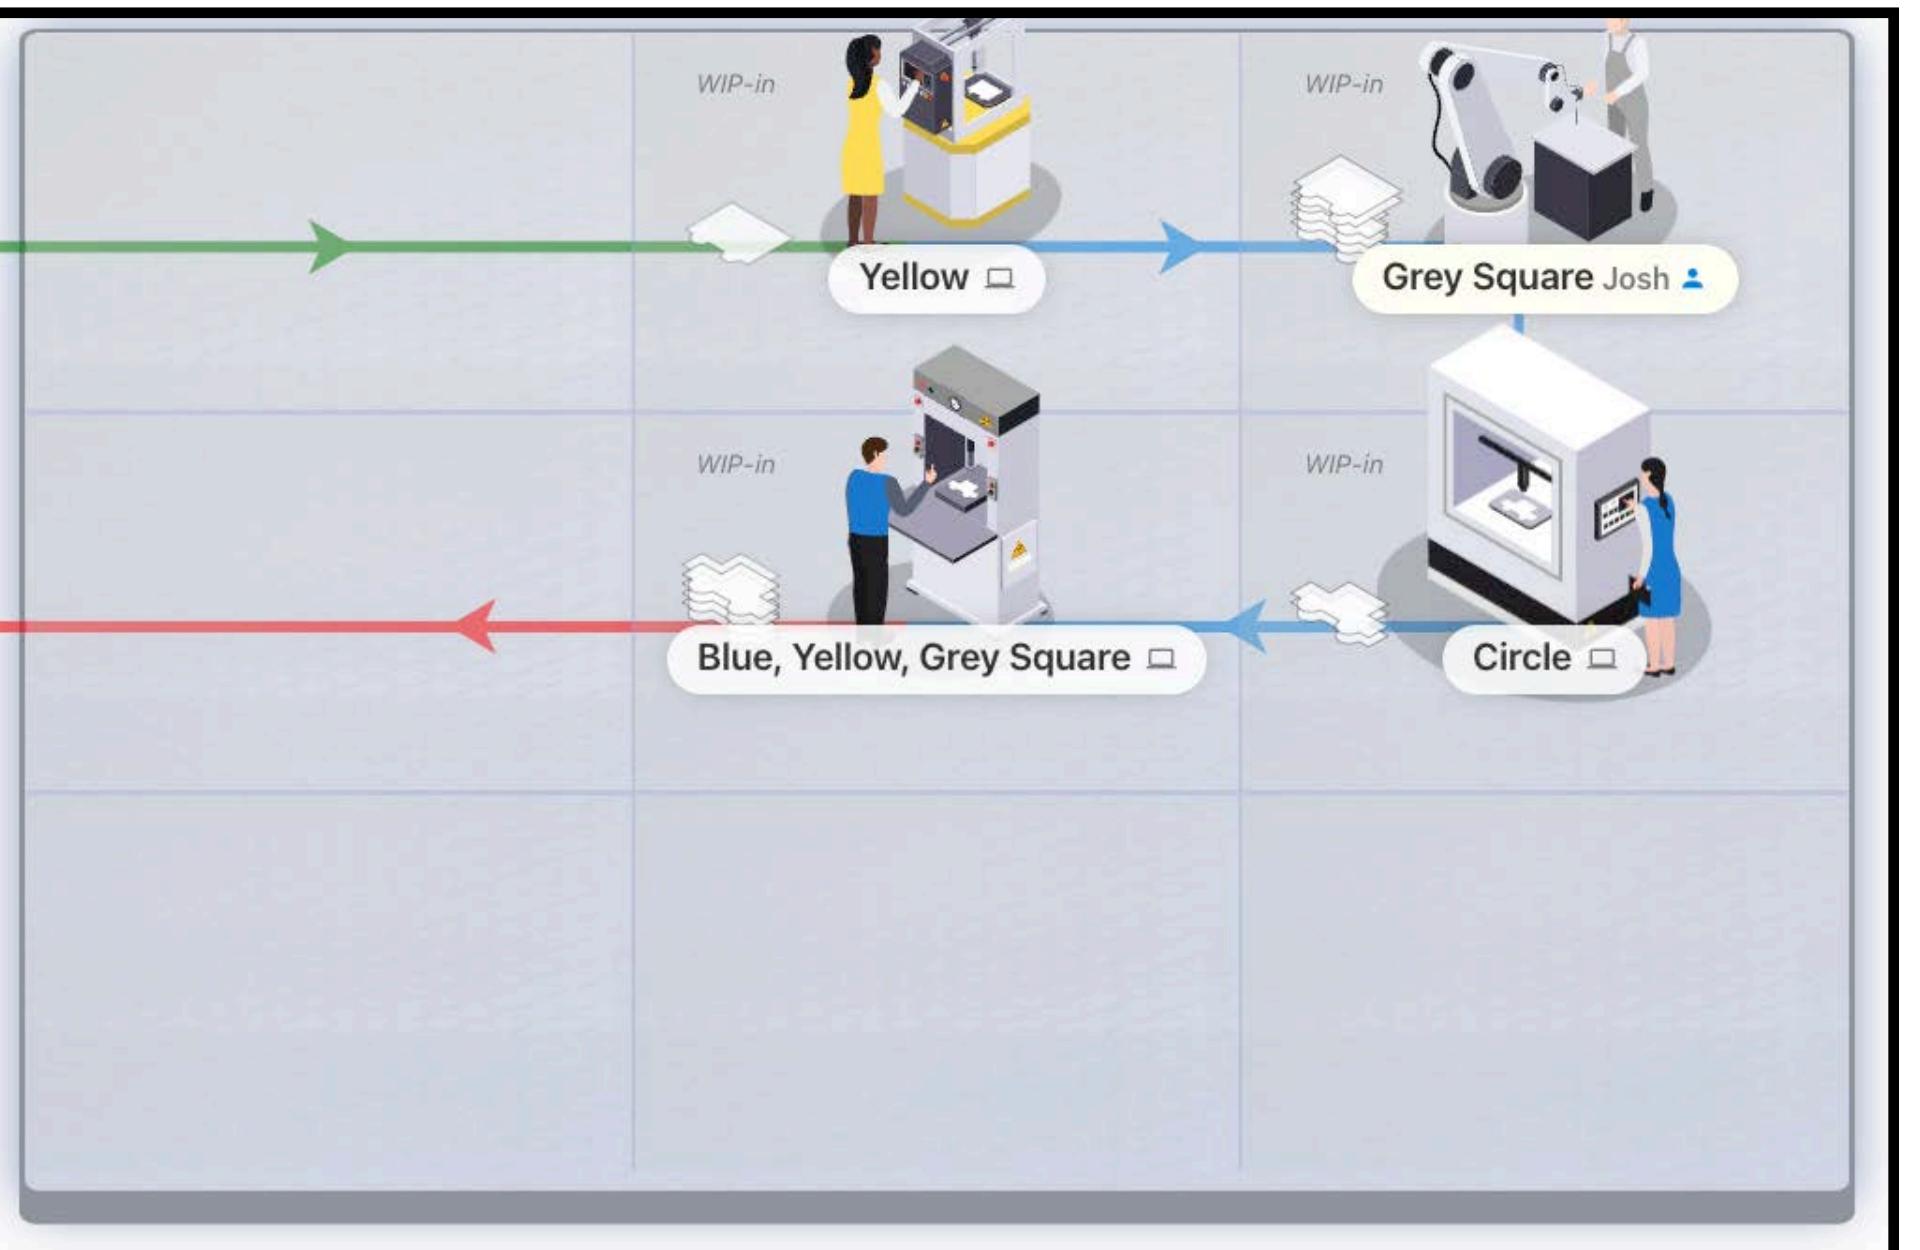

Move Stations: allows you to reorganize the station locations in the workshop

Reduce Batch Size: change the required number of units in a batch

Auto-inspect Work (Jidoka): any/all stations will be able to remove the paint dots after placing them ([click a painted square to remove](#))

Balance Workload: any/all stations can be configured to allow for tool changing, not just Quality & Rework

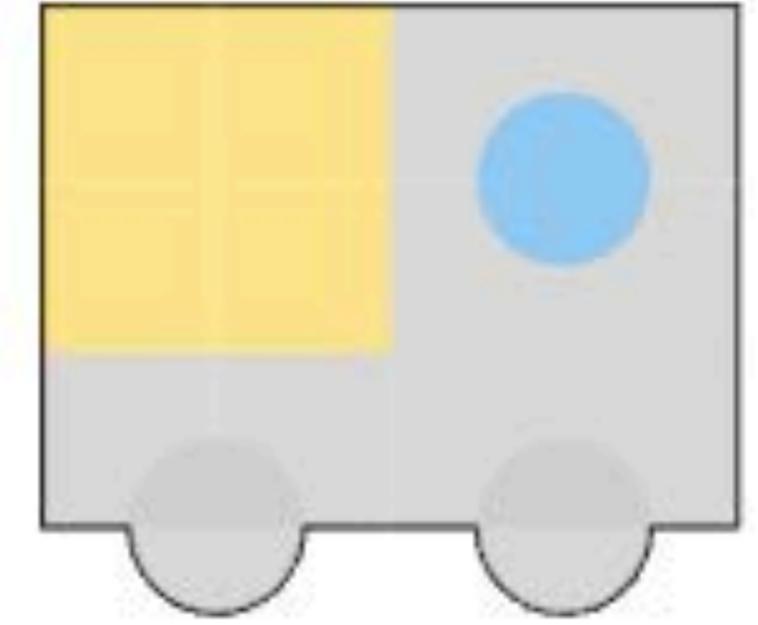

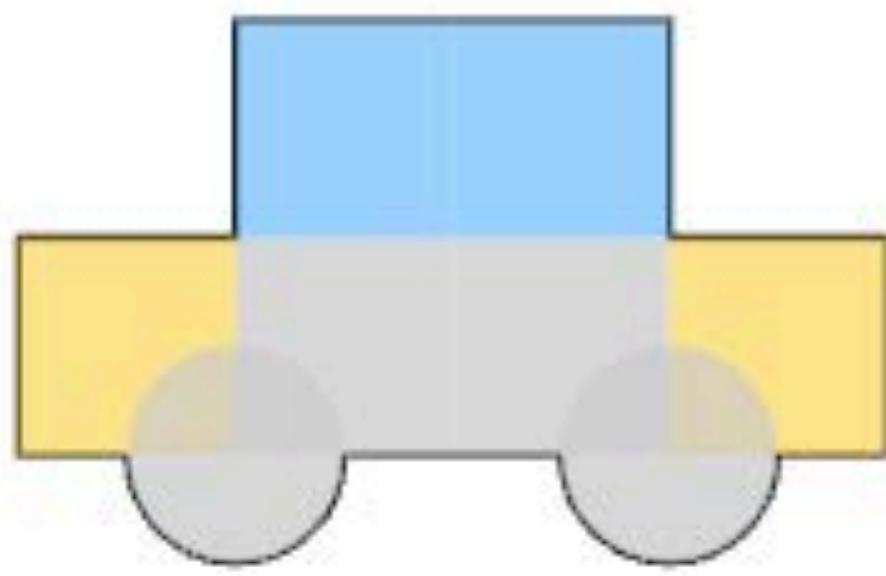

Manufacturing Systems III

System Design and Simulation #2: Lean Game

25

Agenda

1. play **Round 1** – Basic Factory (communication encouraged!)
2. understand the results by following the Challenge packet
3. play **Round 2** – four “Lean” improvements automatically implemented
4. play **Round 3** - all (four more) “Lean” improvements automatically implemented

Move Stations: allows you to reorganize the station locations in the workshop

Reduce Batch Size: change the required number of units in a batch

Auto-inspect Work (Jidoka): any/all stations will be able to remove the paint dots after placing them

Balance Workload: any/all stations can be configured to allow for tool changing, not just Quality & Rework

Level Production Plan (Heijunka): change the production schedule to make it more even

Add Click-guides to Reduce Defects (Poka-yoke): guides will help you choose where to click to make painting easier

Kanban (Pull System): pieces will automatically move to the next station

Reduce Tool-changeover Time (SMED): tool changeover times happen faster
