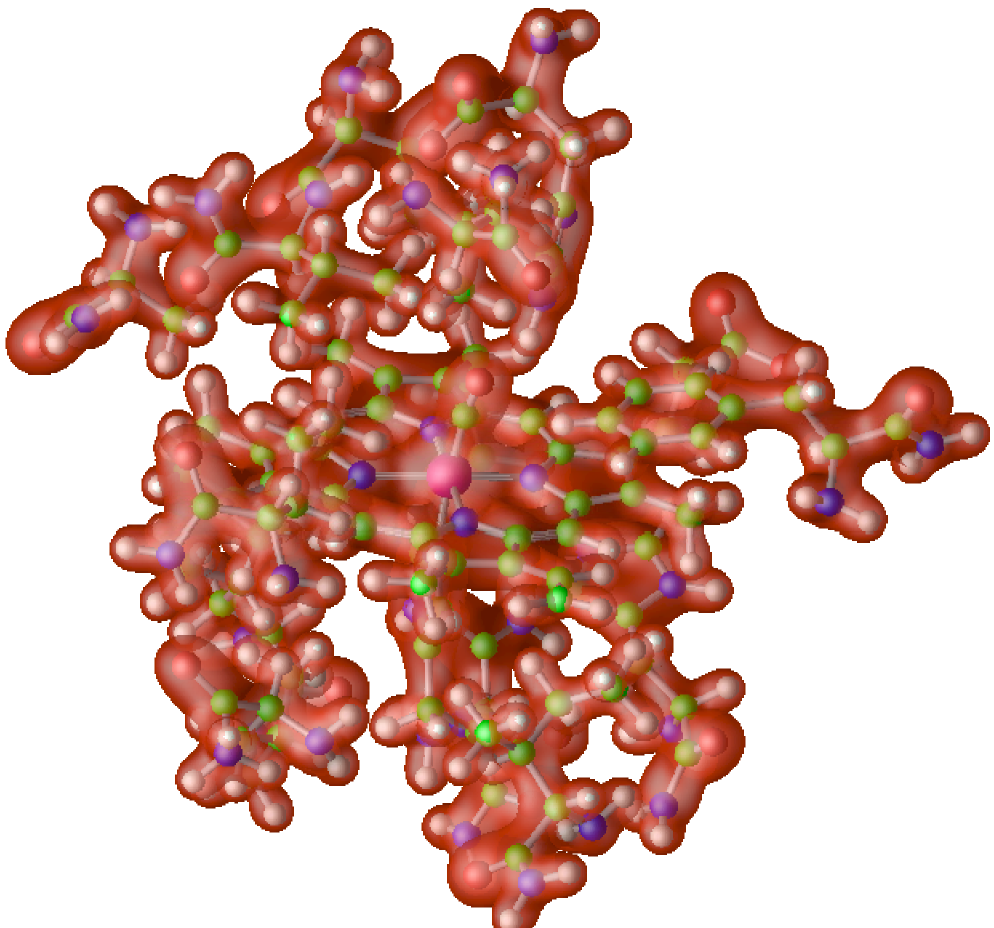
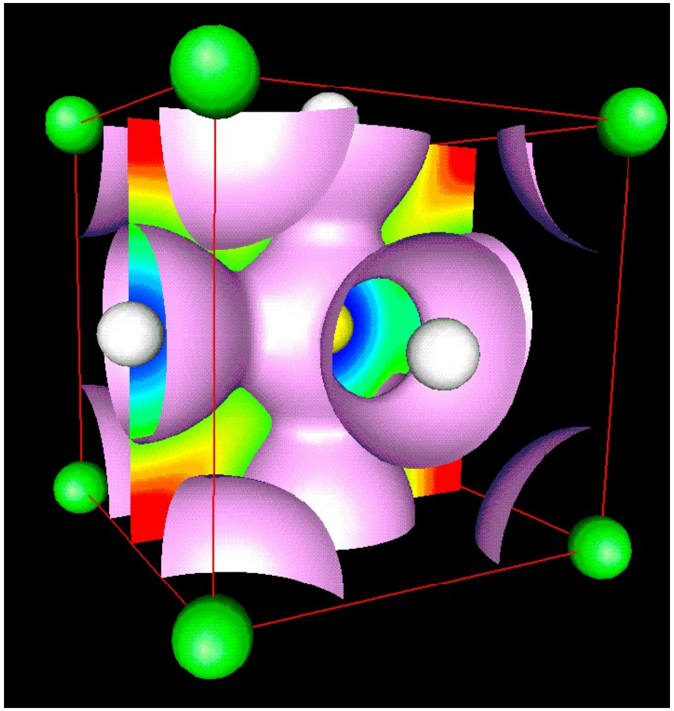
3.320: Lecture 3b (Feb 8 2005)

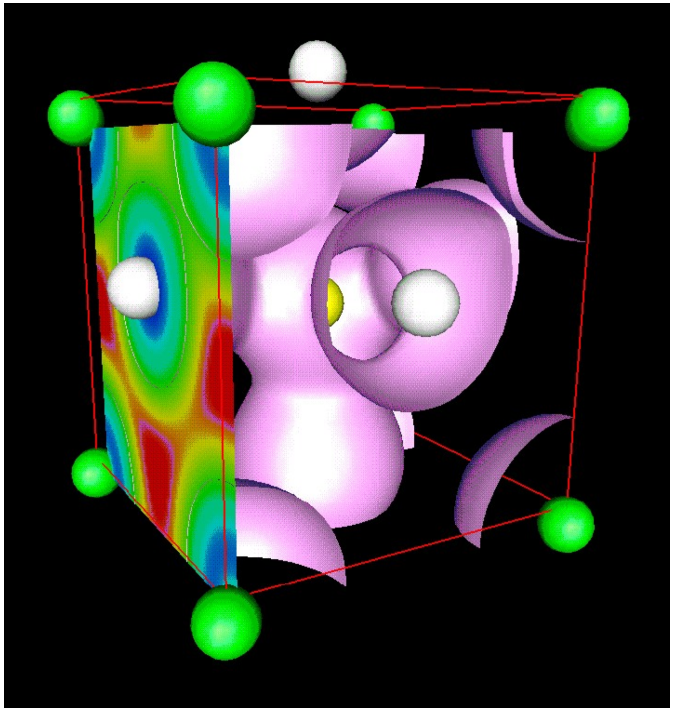
IT'S A QUANTUM WORLD !



Why do we need quantum mechanics ?

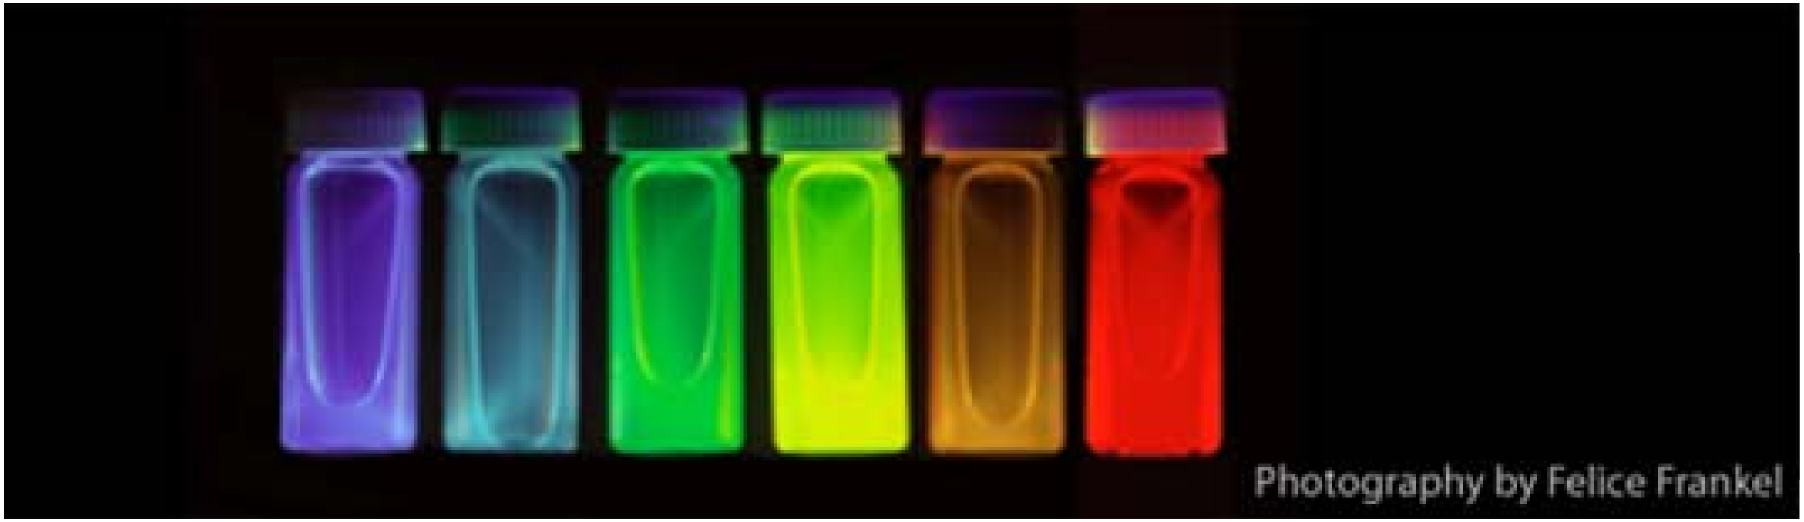
1) Bonding and Structure





Paraelectric (cubic) and ferroelectric (tetragonal) phases of $PbTiO_3$

2) Electronic, optical, magnetic properties



3) Dynamics, chemistry

Diels-Alder Reaction:
1,3-butadiene + ethylene → cyclohexene

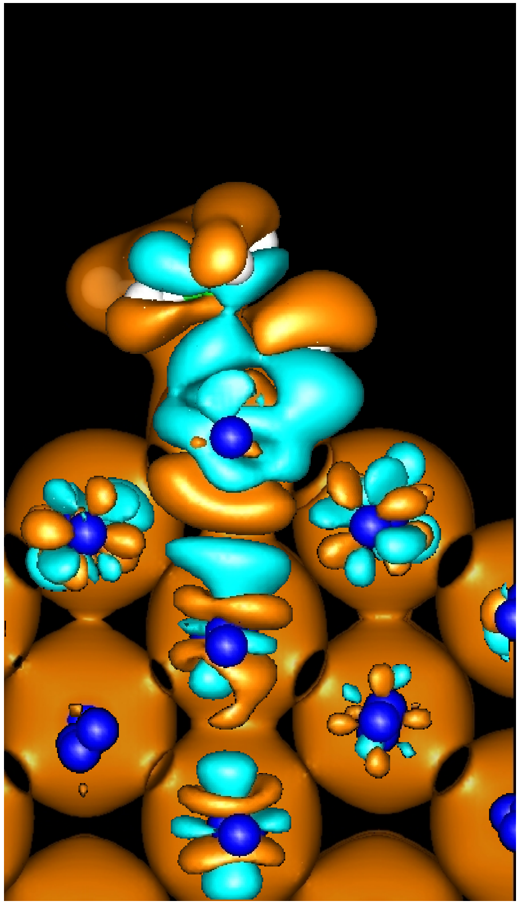
Standard Model of Matter

- Atoms are made by massive, point-like nuclei (protons+neutrons)
- Surrounded by tightly bound, rigid shells of core electrons
- Bound together by a glue of valence electrons



Material Properties From First-Principles

- Energy at our living conditions (300 K): 0.04 eV (kinetic energy of an atom in an ideal gas: 3/2 $k_B T$).
- Differences in bonding energies are within one order of magnitude of 0.29 eV (hydrogen bond).
- Binding energy of an electron to a proton (hydrogen):
  13.6058 eV = 1 Rydberg (Ry) = 0.5 Hartree (Ha) = 0.5 a.u

Wave-particle Duality

- *Waves have particle-like properties:*
  - *Photoelectric effect: quanta (photons) are exchanged discretely*
  - *Energy spectrum of an incandescent body looks like a gas of very hot particles*
- Particles have wave-like properties:
  - Electrons in an atom are like standing waves (harmonics) in an organ pipe
  - Electrons beams can be diffracted, and we can see the fringes

When is a particle like a wave ?

Wavelength • momentum = Planck

$\updownarrow$

$\lambda \bullet p = h$ ($h = 6.6 \times 10^{-34}$ J s)

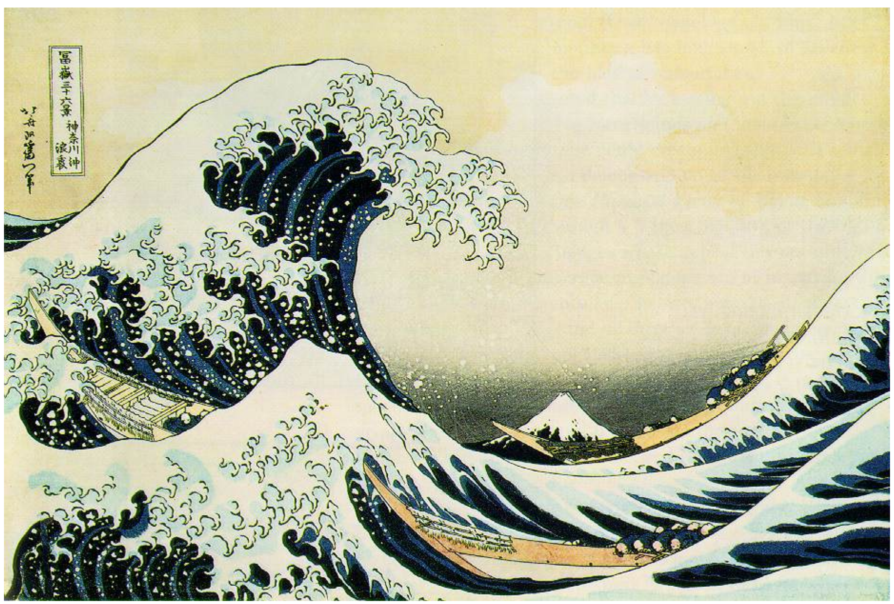
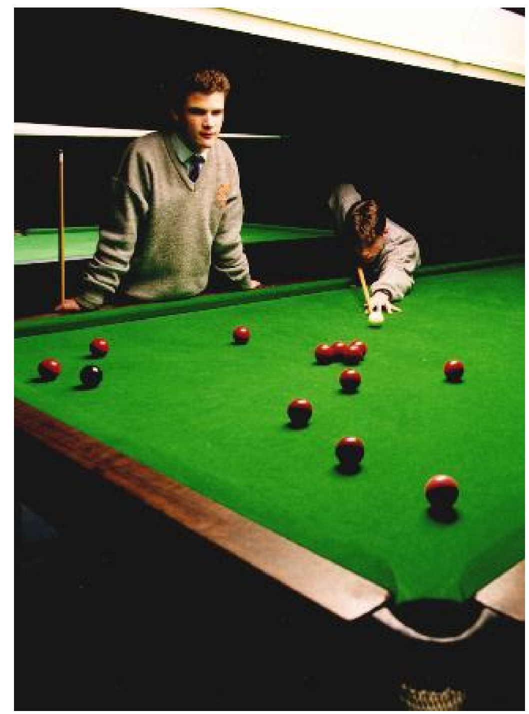
"Effect of Quantum Fluctuations on Structural Phase Transitions in $SrTiO_3$ and $BaTiO_3$", W. Zhong and David Vanderbilt, Phys.Rev. B 53, 5047 (1996)

So, What Is It ? A Misnomer…

It's the mechanics of waves, instead of classical particles





Mechanics of a Particle

$$m\frac{d^2\vec{r}}{dt^2} = \vec{F}(\vec{r}) = -\vec{\nabla}V(\vec{r}) \longrightarrow \begin{matrix} \vec{r}(t) \\ \vec{v}(t) \end{matrix}$$

The sum of the kinetic and potential energy is conserved

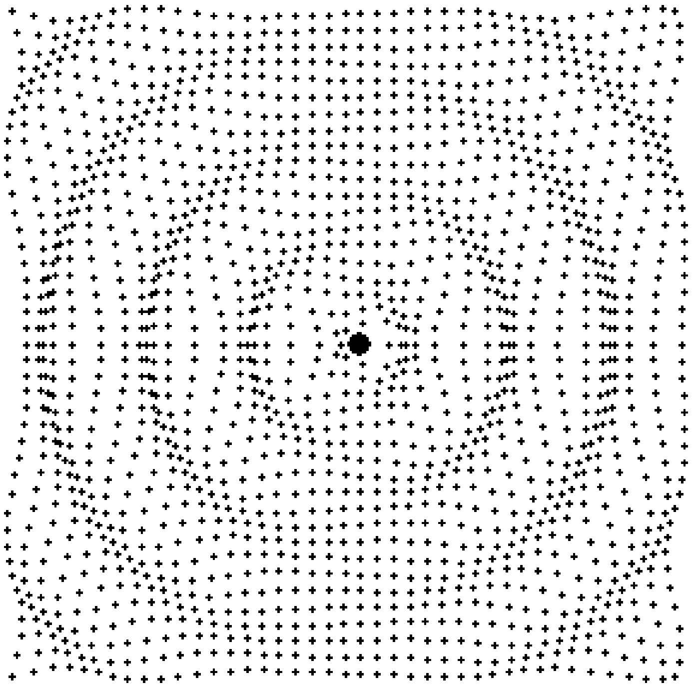
Cannon firing a cannonball.

Description of a Wave



The wave is an excitation (a vibration): we need to know the amplitude of the excitation at every point and at every instant

$$\Psi = \Psi(\vec{r}, t)$$

Time-dependent Schrödinger's equation

(Newton's 2nd law for quantum objects)

$$\boxed{-\frac{\hbar^2}{2m}\nabla^2\Psi(\vec{r},t)+V(\vec{r},t)\Psi(\vec{r},t)=i\hbar\frac{\partial\Psi(\vec{r},t)}{\partial t}}$$

1925-onwards: E. Schrödinger (wave equation), W. Heisenberg (matrix formulation), P.A.M. Dirac (relativistic)

Stationary Schrödinger's Equation (I)

$$-\frac{\hbar^2}{2m}\nabla^2\Psi(\vec{r},t)+V(\vec{r},\cancel{t})\Psi(\vec{r},t)=i\hbar\frac{\partial\Psi(\vec{r},t)}{\partial t}$$

Stationary Schrödinger's Equation (II)

$$\boxed{\left[-\frac{\hbar^2}{2m}\nabla^2 + V(\vec{r})\right]\varphi(\vec{r}) = E\varphi(\vec{r})}$$

Interpretation of the Quantum Wavefunction (Copenhagen)

$\left\| \Psi(\vec{r}, t) \right\|^2$ is the probability of finding an electron in r and t

$$\left\| \varphi(\vec{r}) \exp(-\frac{i}{\hbar} E t) \right\|^2 = \left\| \varphi(\vec{r}) \right\|^2$$
